FEEDBACK

As Building Information Modelling (BIM) and related digital technologies are developing rapidly, it is expected that the Quantity Take-off practice may also undergo an evolutionary change. The Hong Kong Institute of Surveyors welcomes comments and proposed changes to this publication and encourages readers to notify us of any apparent inaccuracies for further improvements in the subsequent revision.

ACKNOWLEDGEMENT

The Quantity Surveying Division of The Hong Kong Institute of Surveyors would like to thank the following members of the Digitalisation Sub-committee for their contributions to this publication:

Mr. CHOI Shing Lam, Sunny (Chairman)
Miss CHAN Ka Li, Lily
Mr. CHENG Seng Yip, Felix
Dr. HO Hok Keung, Paul
Mr. HUI Put
Mr. KUO Fung, Kelvin
Mr. LEUNG Man Kong, Ken
Mr. LI Xiao Xiang Mike
Mr. LO Kin Fat, Kenneth
Ms. OR Ching Sze, Sundy
Ms. SHUM Kai Sum, Katherine
Ms. SZETO Cynthia
Mr. TANG Ki Cheung
Mr. TSE Tung, Anthony
Mr. YAN Stanley
Ms. YEUNG Sau Fung, Ellie
Mr. YING Chung Sau, Rex

Part A – Introduction

SECTION 1 – GENERAL PRINCIPLES

1.1 BACKGROUND

Building Information Modelling (BIM) has been implemented in Hong Kong for several years. At the early stage of development, BIM was only voluntarily adopted by some well-established developers, design consultants and contractors. Since 2019, cost estimation has been specified by the Development Bureau as one of the mandatory BIM uses in government capital works projects. According to CIC BIM Standards – General (Version 2.1 – 2021):

> *Cost Estimation / 5D modelling is a process in which BIM can be used for cost estimates throughout the life cycle of a project.*
>
> *(a) Quantity Take-off and cost estimating*
>
> *In the design stage, the Information Models can generate more accurate quantities for project cost budgeting, project cost control and cost evaluation on design options, etc. as far as practicable.*
>
> *In the tender stage, the Information Models can be used for extracting quantities in the preparation of pricing documents [and the Information Models shall form part of tender information to indicate the design intent layout and the material quantities for the tenderers' information].*
>
> *(b) 5D modelling / cash flow forecasting*
>
> *In the construction stage, the Information Models can be used for extracting quantities for project cost control, cost evaluation on the variation of works, cash flow forecast, spending analysis, interim payment, etc. as far as practicable. The 5D Model shall be adopted in the regular project progress meetings to indicate and compare the current cash flow status with the baseline forecast to facilitate project management.*
>
> *(Note: the term "information model" is defined under ISO 19650-1:2018.)*

In fact, **Quantity Take-off (QTO)** is the first and foremost essential task for the preparation of pre-construction cost estimates, cost plans, bills of quantities, quotations, schedule of quantities and rates, and bills of materials for ordering, programme planning, progress payment valuation, post-contract cost estimating, re-measurement of provisional quantities and variations, etc. With the advent of BIM, the traditional meaning of QTO, whereby the dimensions of work and materials are measured from the drawings one by one and further calculated to give the quantities, should be updated to mean ***extraction and generation of quantities from the BIM models for various cost management needs***. Such needs are applicable to any person (not just quantity surveyors) who is required to determine the quantities of work to be done (or already done) or materials to be ordered, and the quantities so extracted or generated must suit the established practice of classification and itemisation for cost management needs.

The quantity surveying discipline has been proactively exploring how to adopt BIM in quantity surveying practices throughout the project life cycle. Projects utilising BIM models for QTO, cost estimating and other cost management functions are growing. However, there are still many issues to be resolved to achieve a higher degree of collaboration with other disciplines. While several BIM standards have been released in the industry, these standards and most of the BIM models being produced in projects have not adequately prescribed or been modelled in such a way to enable extraction and generation of quantities according to the established practice of classification and itemisation.

The Digitalisation Sub-committee of the Quantity Surveying Division (QSD) of The Hong Kong Institute of Surveyors (HKIS), therefore, took an initiative to prepare this publication listing the QTO information requirements on model elements / objects, and QTO guidelines. It is anticipated that this publication will contribute not only to the best practice of BIM-based QTO, but also facilitate the collaborative practice among stakeholders. For full automation of QTO, further standardisation or coding system has to be explored.

The persons carrying out BIM-based QTO are called "**quantity surveyors**" in this publication, irrespective of their positions or employment in their organizations.

1.2 AIM AND APPROACHES

BIM models of inadequate quality will impair using BIM information for cost management and procurement. Benefits from efficient model-based cost advice or budget monitoring cannot be achieved.

This publication aims to give guidelines to be used by quantity surveyors to share and communicate with the designers and modellers to ensure that the information provided in BIM models can enable the extraction and generation of quantities according to the established practice of classification and itemisation in the pre- and post-contract stages.

The general principles are described in this **Part A**.

The naming of any specific software or brand name is for explaining the origin of the specific content and does not aim at promoting any proprietary product.

Part B presents the common work and trade sections, and describes under each section:

1. *Basic modelling approaches:* this publication does not mandate the modelling approaches*; most of the models included are taken from existing projects and the information for QTO is highlighted for illustration. Geometric modelling relationships have been suggested such that the quantities directly generated from the model can represent the quantities required for QTO with minimum adjustments. Schedulable parameters should be used as much as possible such that the model is truly parametric to avoid the occurrence of a mismatch between the geometry and the input parameter value.

   * To enable smooth workflow and effective data management across the built asset life cycle, standardisation of naming and data format must be agreed upon among different parties. The solution for digitalised workflow is full collaboration among different disciplines to explore the appropriate way.

   In a BIM project, the full information required for tender pricing and construction should be given in the model, and supplementary 2D drawings of construction details and specifications should be provided for study in conjunction (except for the design or development to be further done by the contractors, fabricators and suppliers).

2. *Information requirements for QTO:* the essential information to be included in a specific model element / object / specification / drawing / installation detail. The quantity surveyors are also reminded of what is generally not included in a model element / object. Please also refer to point 4 below.

3. *QTO guidelines:* brief guidelines on how to extract the relevant dimensions or quantities in compliance with the Fifth Edition of the Hong Kong Standard Method of Measurement (HKSMM5) to compile schedules for measurement.

   Note: The HKSMM5 has been drafted but not yet been released when this document "BIM Measurement Information Requirements" is published; quantity surveyors should alert for any final revisions in the HKSMM5 to be launched and make necessary adjustments in the BIM QTO based on this document.

Preambles to Part B:

a) All the information highlighted in red rectangular frames in the **properties palette** (on the left) of model objects has to be provided for QTO;

b) **Dimensions** and **locational levels** of model objects, which are required as the minimum information for construction purposes and thus for QTO, are not repeatedly mentioned again under information requirements for QTO;

c) All the information required for the fields in the **schedules** illustrated in the QTO guidelines have to be provided for QTO; and

d) However, the quantities of the modelled objects are subject to further positional, orientation or shape classifications with adjectives like internal, external, deep, high, straight, curved, horizontal, vertical, sloping, battering, etc., which have not all been detailed in Part B, but should be reflected in the models or schedules as far as possible.

Some essential scheduling, quantity extraction and generation skills for QTO are described in **Part C** for the reference of quantity surveyors.

1.3 CAVEAT

While BIM models can be built progressively (whether by the design consultants, contractors or their BIM consultants), the modelling should be appropriate from the very beginning to avoid abortive work. Therefore, the requirements mentioned in this publication should be observed at the very beginning.

Quantity surveyors should recognize that preliminary models received for cost estimating are mostly not completed yet. Allowances should be made for work reasonably required for the final design but not yet modelled.

The BIM models should be modelled according to the standards, such as those published by the Construction Industry Council (CIC), Housing Authority (HA) or Architectural Services Department (ArchSD), prescribed by the services agreements or works contracts. The scope and fineness of BIM models as required at different project stages are usually defined in the agreements or contracts in terms of the **Level of Information Need** (LOIN) as defined in the CIC BIM Standards – General (Version 2.1 – 2021), which comprises three components: **Level of Graphics** (LOD-G), **Level of Information** (LOD-I), and **Documentation** (DOC). LOD-G has four generic levels of graphical representation: LOD-G 100, LOD-G 200, LOD-G 300, and LOD-G 400, and LOD-I has five levels, namely LOD-I 100, LOD-I 200, LOD-I 300, LOD-I 400 and LOD-I 500.

Quantity surveyors should refer to the services agreements and works contracts and other relevant documents such as the BIM Execution Plan (BEP) to understand what level of model details could be obtained at each stage of work. It should be noted that notwithstanding the specified standards and LOIN, the fundamental principle is that the BIM models should be adequate for the intended purposes at different points in time. If they are not, the designers and the modellers should be informed of any errors or omissions, if found by the quantity surveyors, for supplement or corrections. For good BIM implementation in a project, it is necessary to involve quantity surveyors from the outset to agree on the information requirements for cost management purposes in different stages of work.

The Ideal BIM model should ultimately represent the work to be done or already done, sufficiently and accurately, with no errors or omissions.

However, BIM models prepared by the design consultants or their BIM consultants may be intended for design authoring, design review and drawing generation only and, if given to the tenderers / contractors, are intended to be for reference only without any contractual implication. Care should be exercised when using such BIM models for preparing bills of quantities or schedules of quantities and rates. This situation is not ideal for the implementation of BIM in construction projects. The HKIS BIM Contract Conditions (First Edition, April 2020) has a provision to include “Design Model” as part of contract documents. The Development Bureau (DEVB) Technical Circular (Works) No. 2/2021 and its updates dated 13 June 2023 mention that it is the goal of DEVB to include BIM models as part of tender information and make them contractually binding, and Works Departments shall work towards the goal.

On the other hand, BIM models prepared by the contractors or their BIM consultants may serve different purposes from those prepared by the architects or engineers, and these models may contain fabrication details and as-built work which are not a measurable item for payment according to the methods of measurement used for the bills of quantities or schedule of quantities and rates. Care should be exercised when these BIM models are the only available models for QTO in the post-contract stage of a project.

When BIM models are built according to the agreed approaches and LOIN, and the BIM models are reviewed by model authors to remove errors or omissions, then quantity surveyors should be able to do BIM QTO by extracting information and quantities for cost management, effectively from the BIM models. While it may not yet be ideal that the deliverables may be generated from the click of a single button, the whole BIM QTO process will be benefited from the automated collection and categorization of data, thus facilitating quantity surveyors to provide clients with more active cost advice against any design changes in a project.

Part B – BIM Model Information Requirements for Quantity Take-off

SECTION 2 – EXCAVATION

2.1 SITE AND FOUNDATION EXCAVATION

2.1.1 BASIC MODELLING APPROACHES

(A) Model comparing existing and new toposurfaces:

Create two toposurfaces, one representing the profile of existing / commencing levels and another representing the profile of excavated levels. Cut and fill volumes will be generated when the two toposurfaces are compared.

If no existing toposurface object is available, import drawings of existing toposurface for creating the existing toposurface object in the model.

By using the building pad approach, quantities of excavation could be derived. Unless otherwise agreed with modellers, quantity surveyors will carry out the building pad approach as illustrated in Section 2.1.3.

For site formation:

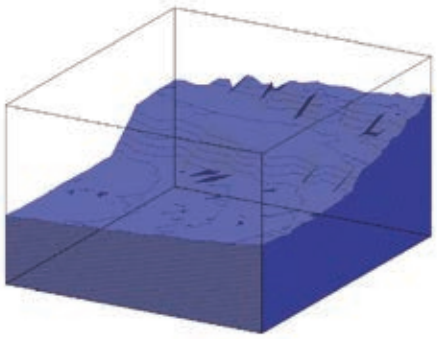

Figure 2.1.1 – Commencing levels

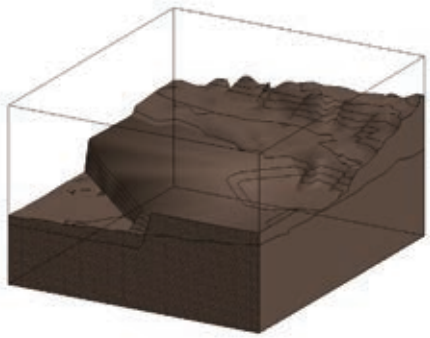

Figure 2.1.2 – Excavated levels

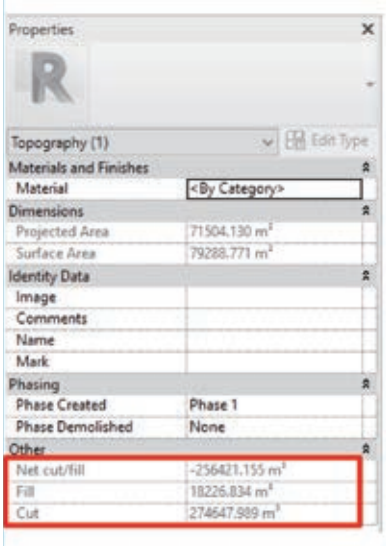

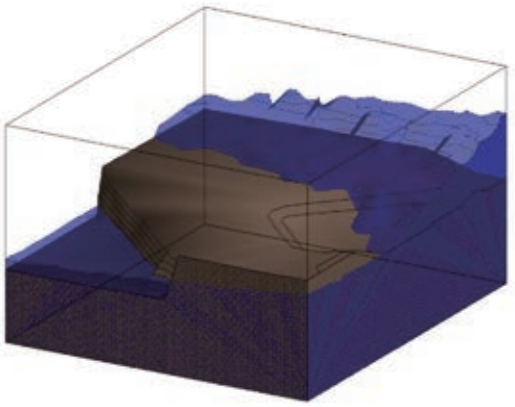

Figure 2.1.3 – Combined profile

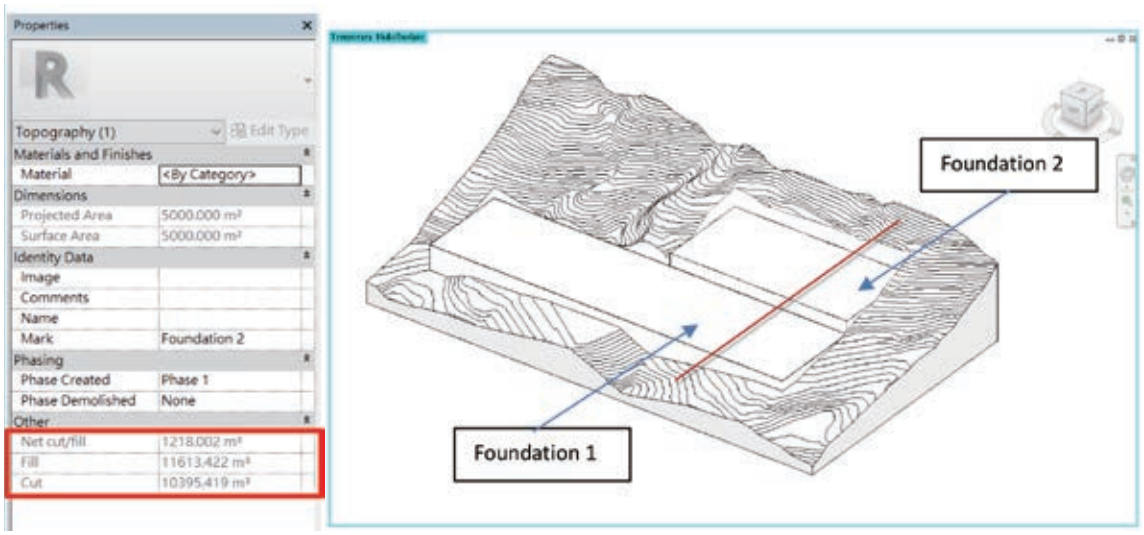
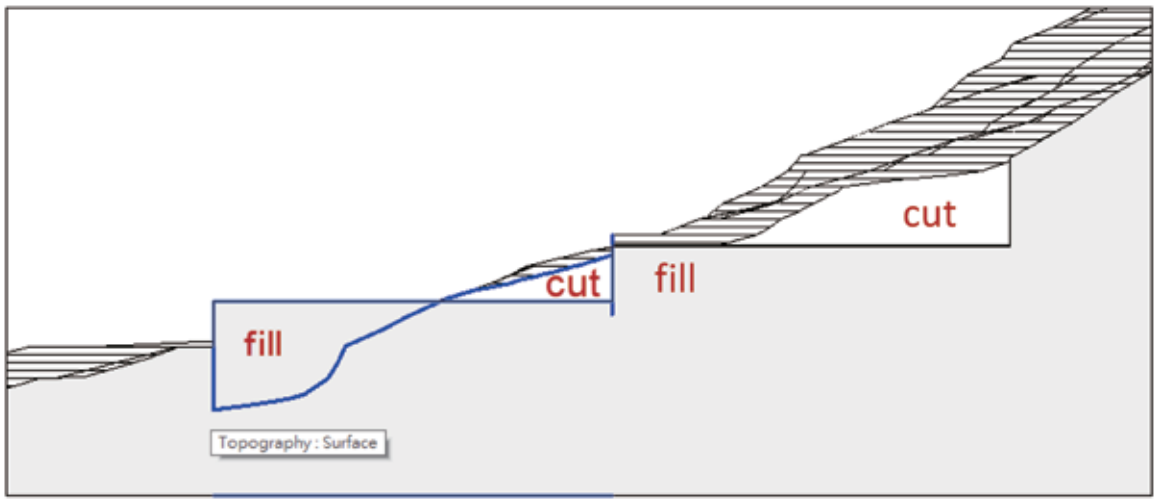
(B) Model with building pad in existing toposurface:

Create a system family type for each type and thickness of building pads, and place the individual object in the design location to the required boundary. If different levels of foundation are encountered, create separate building pads.





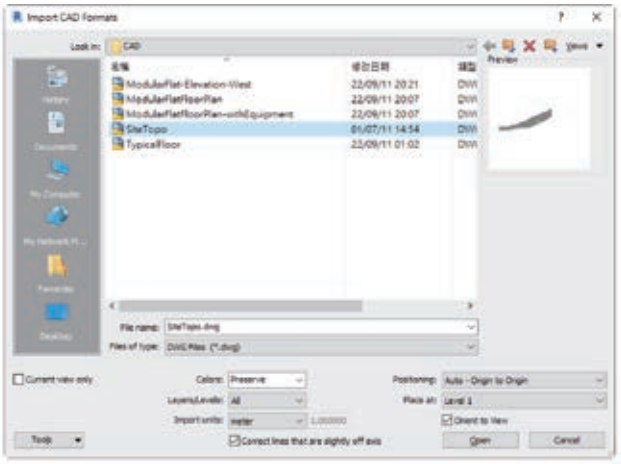
Methods on how to create toposurface and building pad:

1. Create toposurface

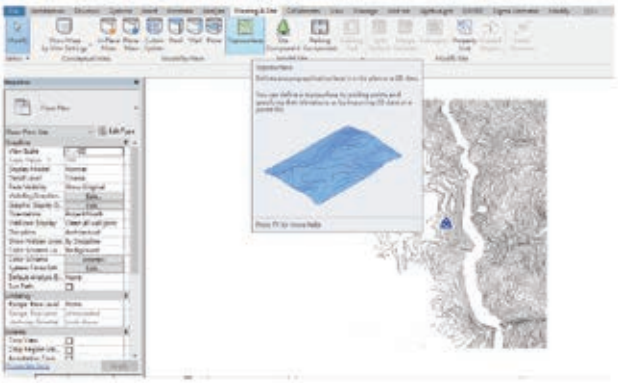
Create New Project.

Open Site Floor Plan.

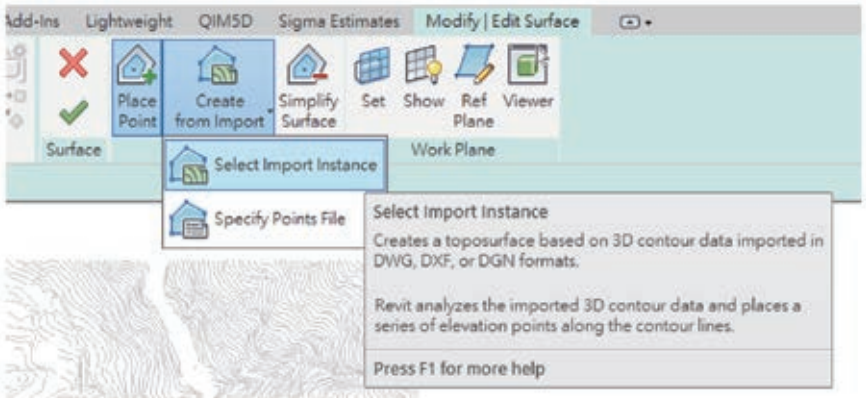
Import CAD “SiteTopo.dwg”, select “meter” for import units:



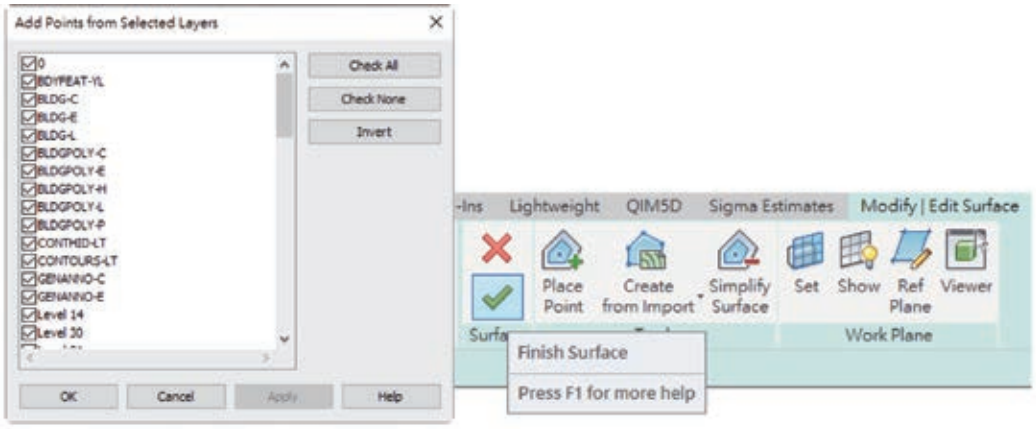
Click “Massing & Site” > “Toposurface”:



Click “Create from Import” > “Select Import Instance”:

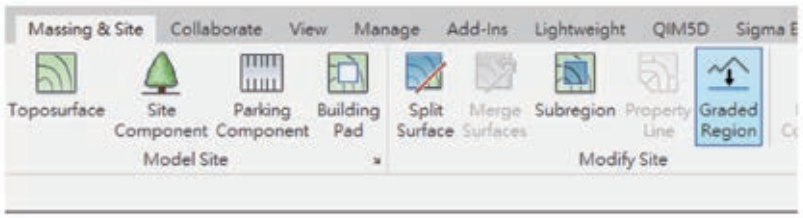


Select the dwg, click “OK” > “Finish Surface”:

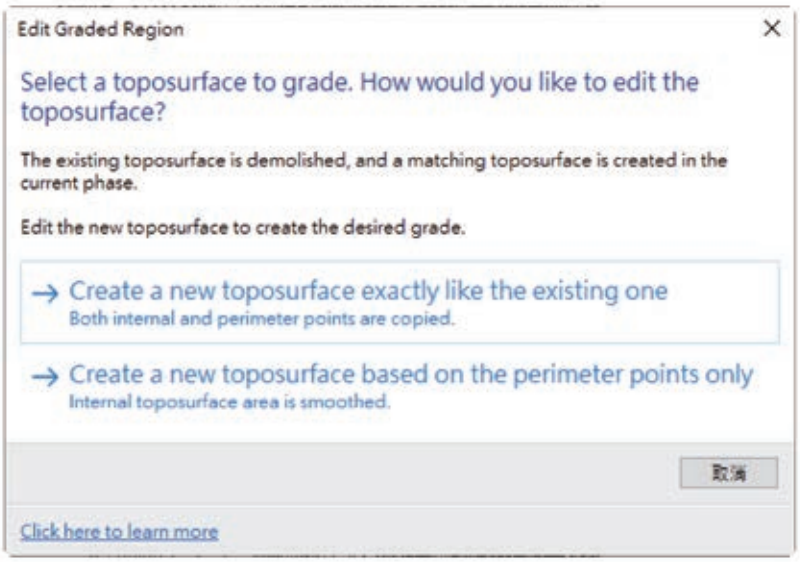


Open 3D view, turn to Top plan view.

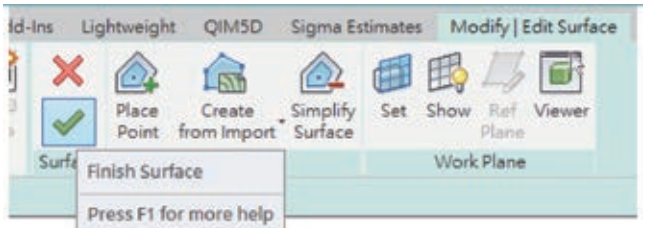
Click “Graded Region” under Massing & Site tab:



Click “Create a new toposurface exactly like the existing one”:

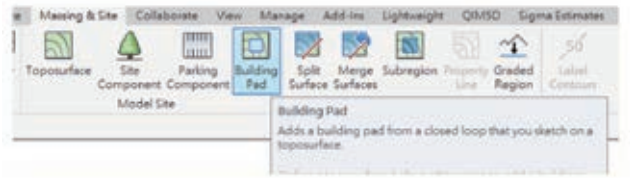


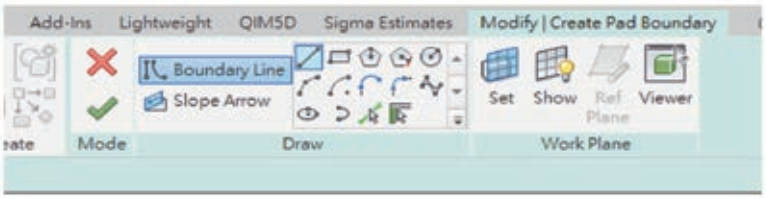
Click the toposurface > “Finish Surface”:

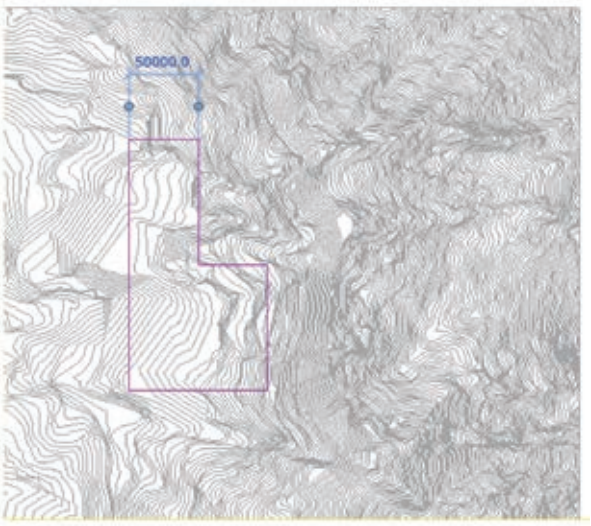


2. Create building pad

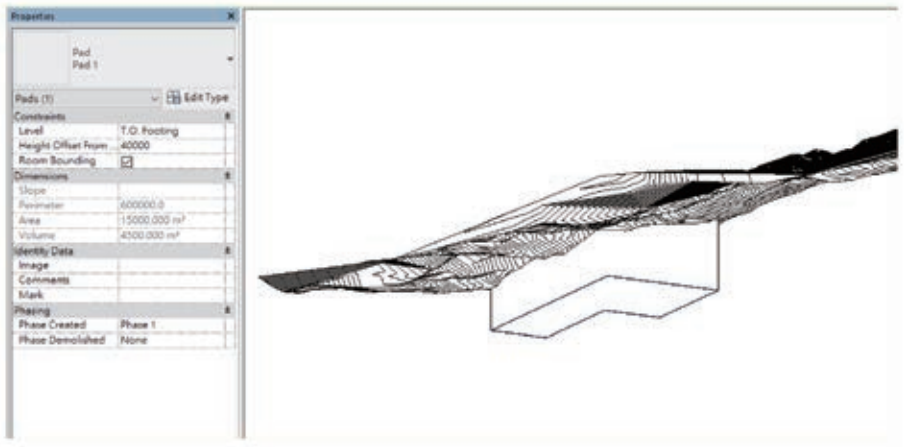
After having a toposurface, create the Building Pad by drawing the boundary line and clicking “Finish Surface”:

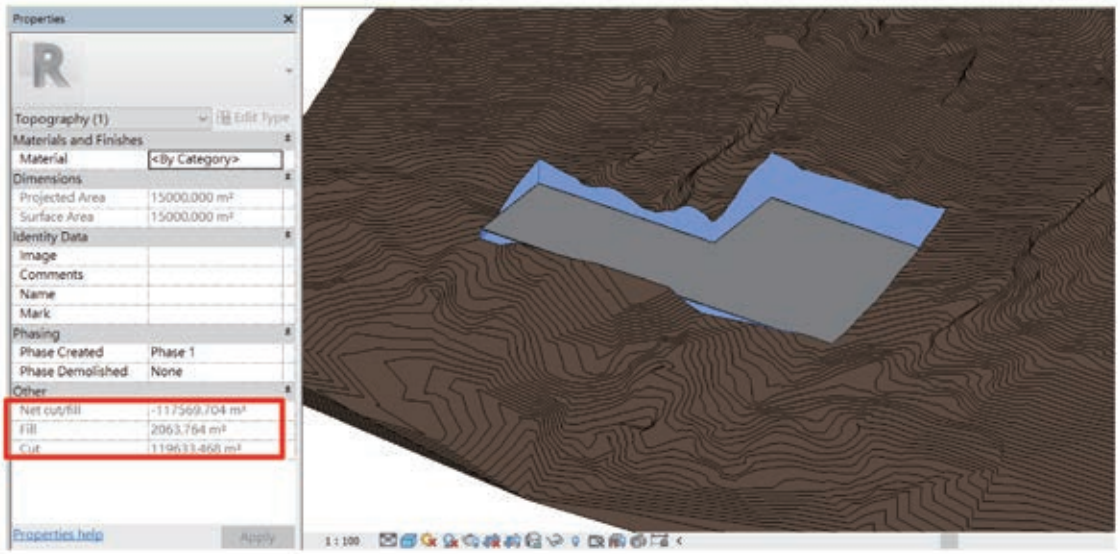






Offset the pad top level to 40000, when the required reduced level is 40300, with the difference of 300mm being the pad thickness. Blinding layer is not included for simplicity.





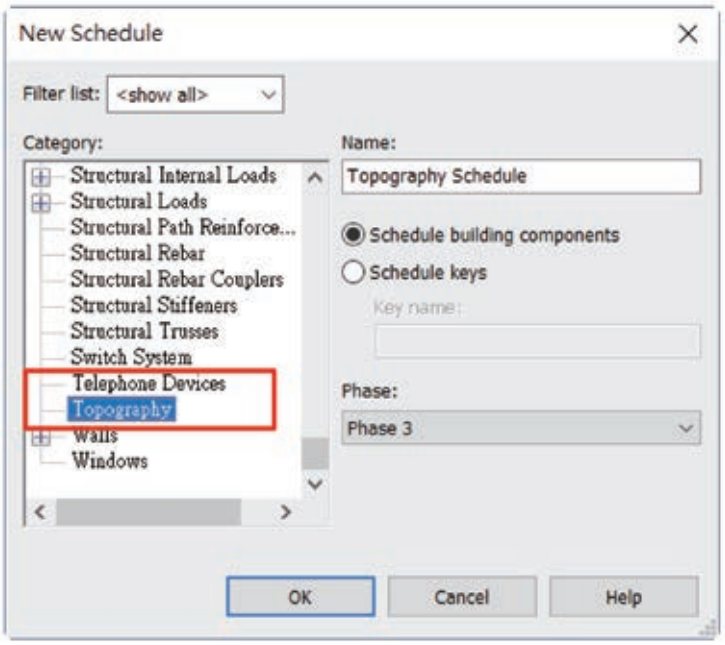
2.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

a) Site formation and excavation requirements.

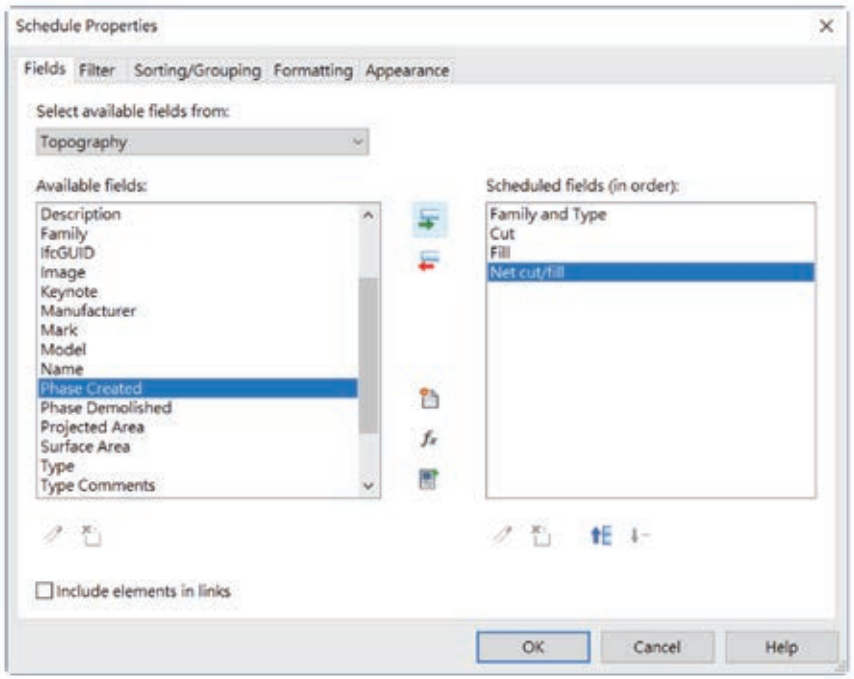
b) Foundation layout and profile with levels and dimensions.

2.1.3 QUANTITY TAKE-OFF GUIDELINES

Create Topography Schedule:



Select “Family and Type”, “Cut”, “Fill”, and “Net cut/fill” fields:



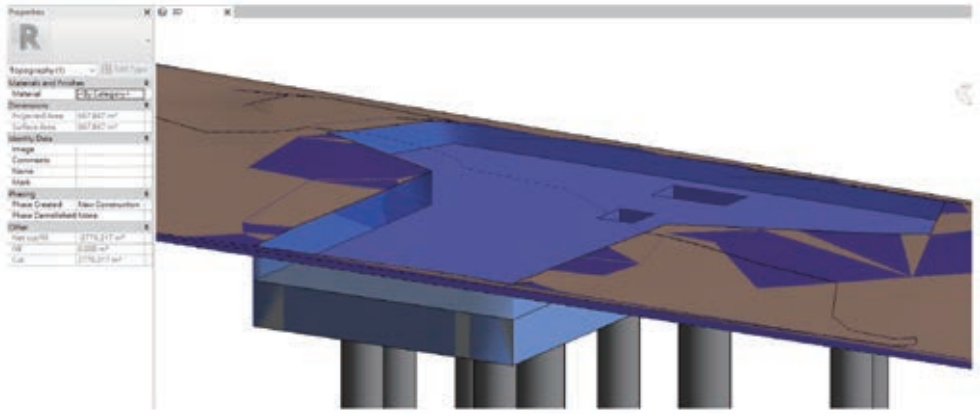
For measurement of the volume of excavation, create a schedule with the following fields:

<Topography Schedule>

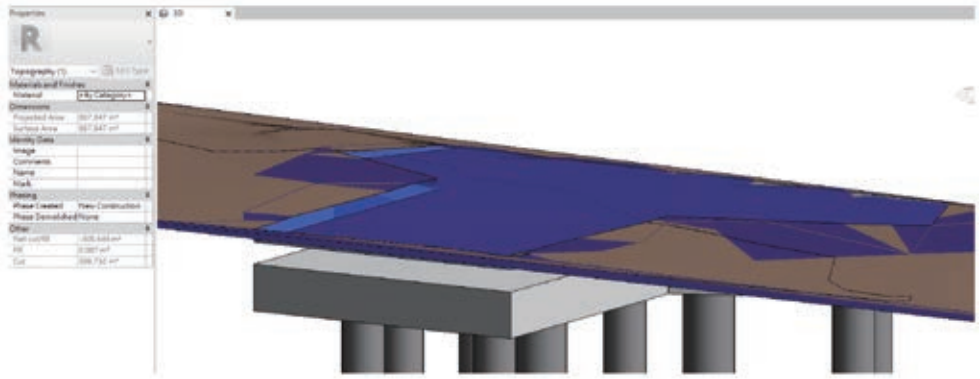
A	B	C	D
Mark	Cut	Fill	Net cut/fill
Foundation 1	3245.36 m³	42457.79 m³	39212.43 m³
Foundation 2	10395.42 m³	11613.42 m³	1218.00 m³
Grand total: 2	13640.78 m³	54071.21 m³	40430.43 m³

The use of Building Pad for measuring quantities of excavation can be done in two ways:

- Option 1: Model Building Pad to bottom level of pile cap to give total bulk excavation volume:



- Option 2: Model Building Pad to required depths in 2 m depth stages according to HKSMM5:



Adjust for the following as necessary:

- Nil.

2.2 EXCAVATION AND LATERAL SUPPORTS

2.2.1 BASIC MODELLING APPROACHES

Excavation and lateral support should be modelled in two major parts. One is supporting wall and the other is strutting system.

For supporting wall, such as sheet piles, soldier piles, interlocking piles, etc., the modelling approaches and information required should refer to “Section 4.1 – Steel Sheet Piling” for details.

For strutting system, including struts, walings, king posts, bracings, etc., the modelling approaches and information required should refer to “Section 9 – Structural Steelwork” for details.

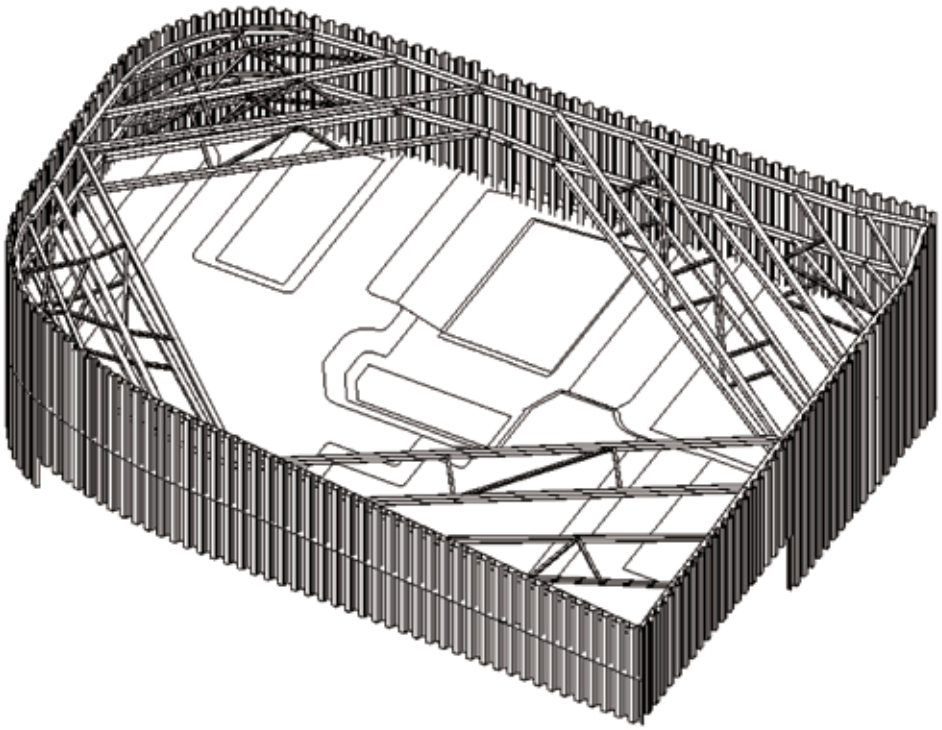


Figure 2.2.1 – 3D View of Excavation and Lateral Support (Engineer’s design)

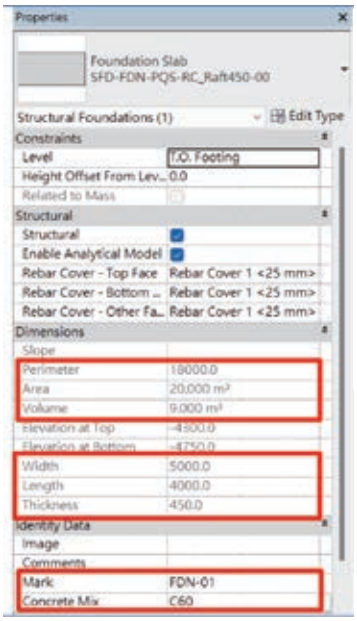
SECTION 3 – FOUNDATIONS

3.1 RAFT FOUNDATIONS

3.1.1 BASIC MODELLING APPROACHES

Based on the structural foundations template, create a system family type for each type and thickness of foundation slabs, and place the individual object in the designed location to the required boundary / profile.

The relevant information that can be extracted from the parameters includes perimeter, area, volume, width, length, thickness, etc.



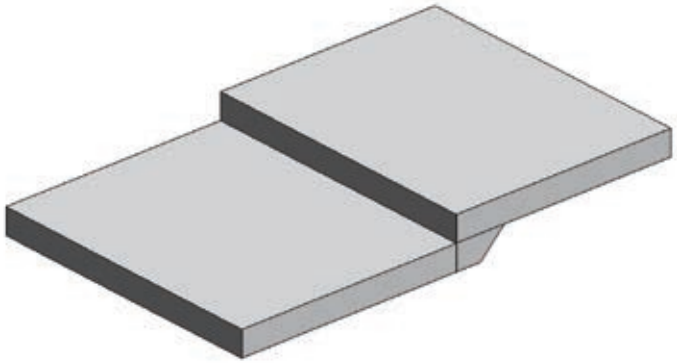


Figure 3.1.1 – 3D View of Foundation Slabs with Level Difference

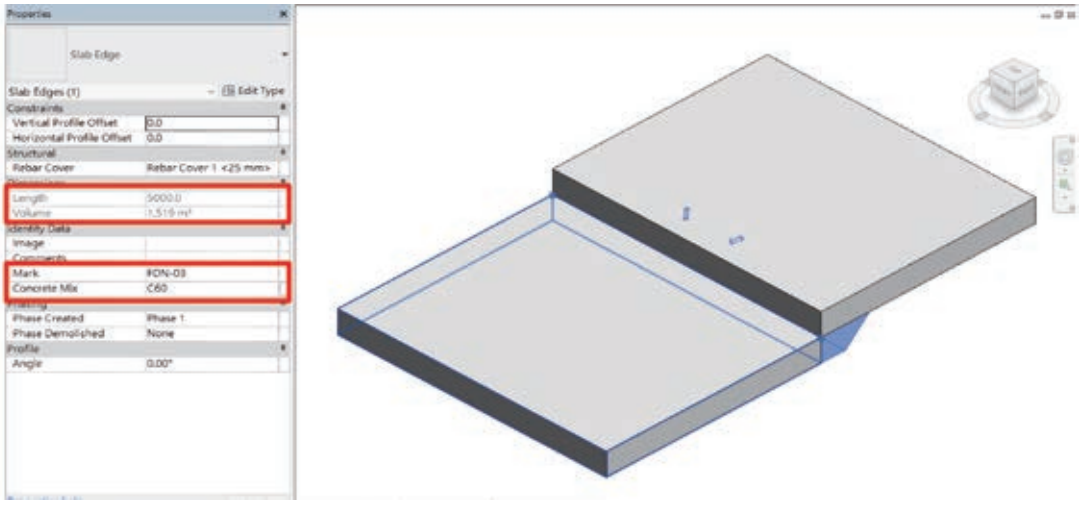
In case there is a level difference, through **Structure > Slab > Floor: Slab Edge**, create a system family type for slab edge (soffit step):



3.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Foundation marks.
2. Mixes or strengths of concrete.
3. Types and extents of specified admixtures, e.g., waterproofing.
4. Thicknesses of blinding layer.
5. Formwork – left-in (if any).

This sample model has not included:

a. Reinforcement.

b. Formwork.

3.1.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of foundations, create a schedule with the following fields:

<Structural Foundation Schedule>

A	B	C	D	E	F	G	H	I	J	K
Family	Type	Mark	Concrete Mix	Length	Width	Thickness	Perimeter	Area	Volume	Side Fwk Area
Foundation Slab	SFD-FDN-PQS-RC_Raft450-00	FDN-01	C60	4000	5000	450	18000	20.00	9.00	8.10
Foundation Slab	SFD-FDN-PQS-RC_Raft450-00	FDN-02	C60	4000	5000	450	18000	20.00	9.00	8.10
Grand total: 2								40.00	18.00	16.20

Set the following formula in the schedule:

- Side Fwk Area = Perimeter * Thickness
- Volume of blinding layer = Area * Thickness of blinding layer, not shown above

For measurement of slab edges (soffit steps), create a schedule with the following fields:

<Slab Edge Schedule>

A	B	C	D	E
Family	Mark	Concrete Mix	Length	Volume
Slab Edge	FDN-03	C60	5000	1.52

Adjust for the following as necessary:

- Formwork at intersected areas of foundations.
- Formwork and blinding layer at steps.

SECTION 4 – PILING

4.1 STEEL SHEET PILING

4.1.1 BASIC MODELLING APPROACHES

Based on one of the generic model templates, create a loadable family type for each type and cross-section size of steel sheet piling by extruding the specified cross-sectional dimensions and profile, and place the individual object in the designed location to the required alignment and top and bottom levels, which may vary depending on the design requirements and actual ground conditions.

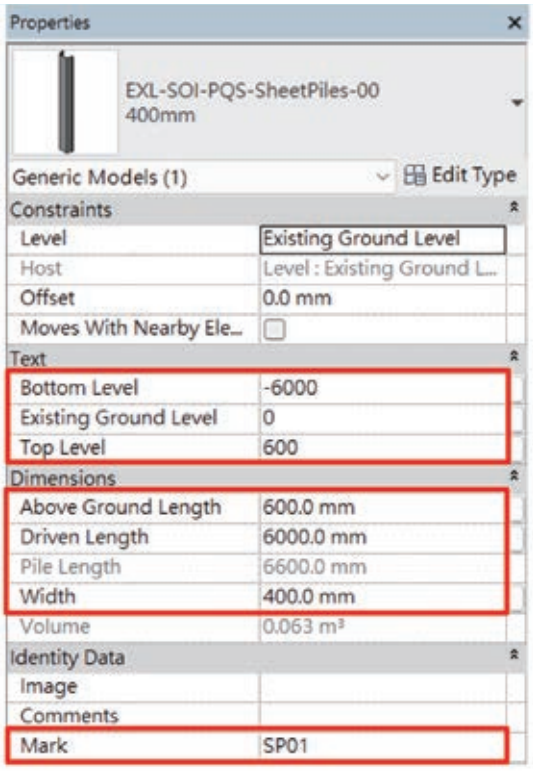
Set the steel sheet piling length as an instance parameter to enable the adjustment of individual piling depth, while its cross-sectional profile is fixed as a type property.

Where there are corner, junction, closure, taper or other special sheet piles, create separate loadable family types for them.

The existing ground or formation levels should be created in the model so that there are reference levels for placing the sheet piles. When precise existing ground or formation levels are unavailable, tentative levels should be given.

Depending upon the design, sheet piles may be projected above or sunken below the commencing levels.

The relevant information that can be extracted from the parameters includes cross-sectional size, length, depth, various levels, etc.



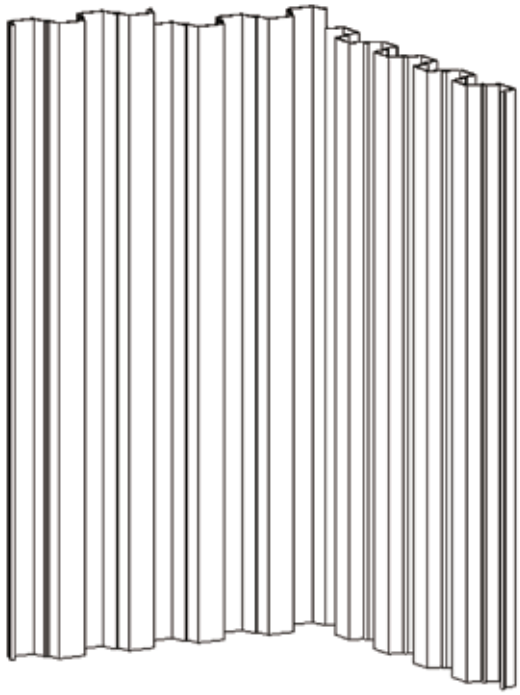


Figure 4.1.1 – 3D View of Steel Sheet Piling

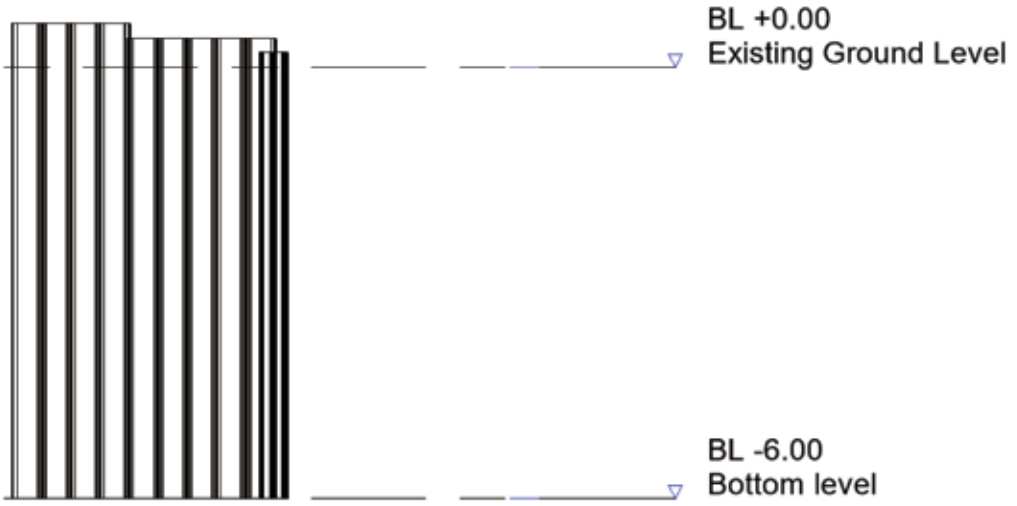

Fig 4.1.2 – Elevation View of Steel Sheet Piling

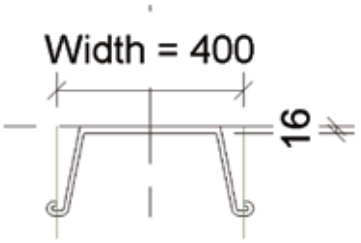

Fig 4.1.3 – Profile of Steel Sheet Piling

4.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Sheet pile marks.
2. Cross-sectional sizes (i.e., widths, heights and thicknesses) and section modulus of sheet piles.
3. Supply (or design) lengths of sheet piles, if designed by the engineer.
4. Commencing levels (which may be existing ground or formation levels) and bottom levels of sheet piles.
5. Any cutting-off surplus lengths be indicated or specified.

This sample model has not included:

a. Initial trenching, temporary strutting, waling and other guides for driving.
b. Pre-boring for sheet piles.
c. Temporary lateral supports to sheet piles.
d. Corner, junction, closure, taper or other special sheet piles.

4.1.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of steel sheet pilings, create a schedule with the following fields:

<Sheet Pile Schedule>

A	B	C	D	E	F	G
Family	Mark	Width	Pile Length	Top Level	Existing Ground Level	Bottom Level
EXL-SOI-PQS-SheetPiles-00	SP10	400 mm	6200 mm	200	0	-6000
EXL-SOI-PQS-SheetPiles-00	SP11	400 mm	6200 mm	200	0	-6000
EXL-SOI-PQS-SheetPiles-00	SP12	400 mm	6200 mm	200	0	-6000
EXL-SOI-PQS-SheetPiles-00	SP13	400 mm	6200 mm	200	0	-6000
EXL-SOI-PQS-SheetPiles-00	SP14	400 mm	6200 mm	200	0	-6000
EXL-SOI-PQS-SheetPiles-00	SP15	400 mm	6200 mm	200	0	-6000
EXL-SOI-PQS-SheetPiles-00	SP16	400 mm	6200 mm	200	0	-6000
EXL-SOI-PQS-SheetPiles-00	SP17	400 mm	6200 mm	200	0	-6000
EXL-SOI-PQS-SheetPiles-00	SP18	400 mm	6200 mm	200	0	-6000
EXL-SOI-PQS-SheetPiles-00	SP09	400 mm	6400 mm	400	0	-6000
EXL-SOI-PQS-SheetPiles-00	SP08	400 mm	6400 mm	400	0	-6000
EXL-SOI-PQS-SheetPiles-00	SP07	400 mm	6400 mm	400	0	-6000
EXL-SOI-PQS-SheetPiles-00	SP06	400 mm	6400 mm	400	0	-6000
EXL-SOI-PQS-SheetPiles-00	SP05	400 mm	6400 mm	400	0	-6000
EXL-SOI-PQS-SheetPiles-00	SP04	400 mm	6600 mm	600	0	-6000
EXL-SOI-PQS-SheetPiles-00	SP03	400 mm	6600 mm	600	0	-6000
EXL-SOI-PQS-SheetPiles-00	SP02	400 mm	6600 mm	600	0	-6000
EXL-SOI-PQS-SheetPiles-00	SP01	400 mm	6600 mm	600	0	-6000

Adjust for the following as necessary:

- Nil.

4.2 BORED PILES

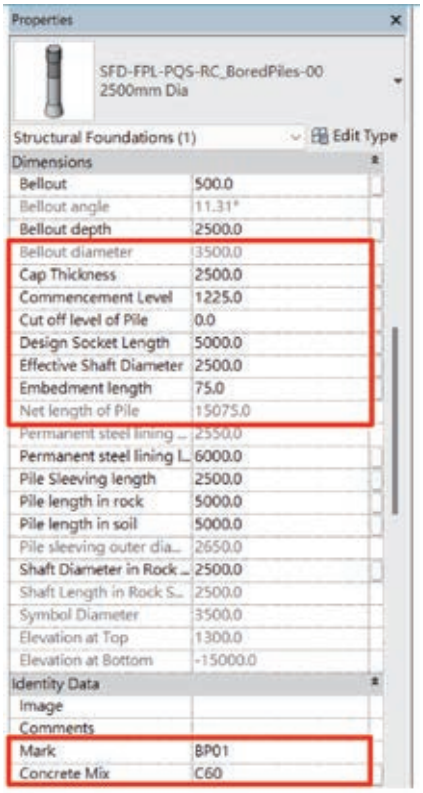
4.2.1 BASIC MODELLING APPROACHES

Based on the structural foundation template, create a loadable family type for each type and cross-sectional size of bored piles by extruding the specified cross-sectional dimensions and profile, and place the individual object in the designed location to the required top and bottom levels, which may vary depending on the design requirements and actual ground conditions.

Set the relevant bored pile dimensions as instance parameters to enable the adjustment of individual length, diameter, permanent steel lining, and bell-out.

The existing ground or formation levels should be created in the model so that there are reference levels for placing the bored piles. When precise existing ground or formation levels are unavailable, tentative levels should be given.

The relevant information that can be extracted from the parameters includes cross-sectional size, length, depth, various levels, etc.



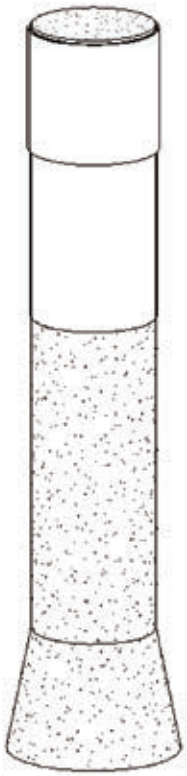


Fig 4.2.1 – 3D View of Bored Pile

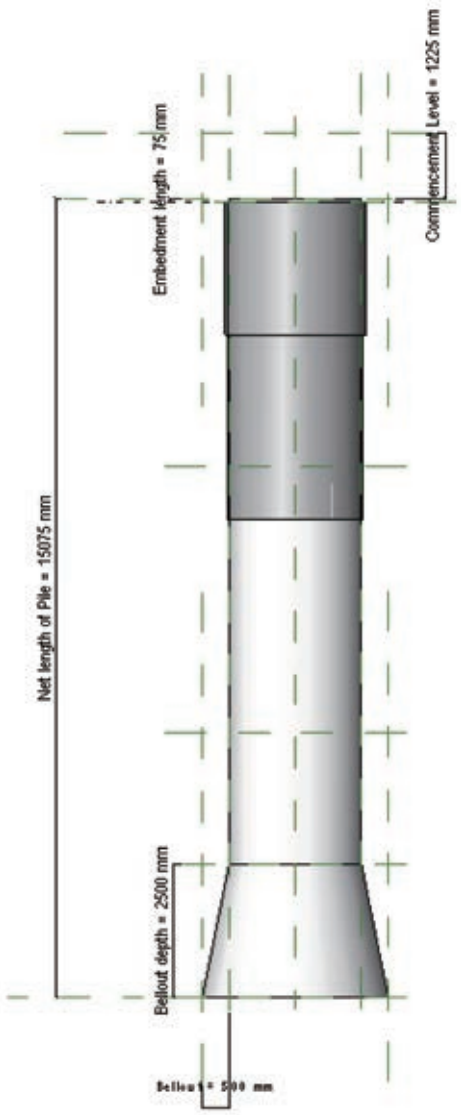

Fig 4.2.2 – Profile of design dimensions

4.2.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Bored pile marks.
2. Nominal diameters of piles and enlarged bases.
3. Commencing levels (which may be existing ground or formation levels), cut-off levels, top levels of bedrock and bottom levels of bored piles.
4. Bottom levels of specified pile sleeving and permanent linings.
5. Mixes or strengths of concrete fillings to pile holes.
6. Socket lengths in bedrock.
7. Internal diameters and thicknesses of permanent linings.

This sample model has not included:

a. Reinforcement and couplers to piles.
b. Non-destructive integrity tests.
c. Drilling and coring tests.
d. Load tests.

4.2.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of bored piles, create a schedule with the following fields:

<Bored Piles Schedule>

A	B	C	D	E	F
Family and Type	Mark	Concrete Mix	Commencement Level	Cut off level of Pile	Permanent steel lining length
SFD-FPL-PQS-RC_BoredPiles-00: 2500mm Dia	BP01	C60	1225	0	6000
SFD-FPL-PQS-RC_BoredPiles-00: 2500mm Dia	BP02	C60	1225	0	6000
SFD-FPL-PQS-RC_BoredPiles-00: 2500mm Dia	BP03	C60	1225	0	6000
SFD-FPL-PQS-RC_BoredPiles-00: 2500mm Dia	BP04	C60	1225	0	6000

G	H	I	J
Socket Length	Net length of Pile	Bellout	Volume of Piles
5000	15075	500	74.00
5000	15075	500	74.00
5000	15075	500	74.00
5000	15075	500	74.00

Set the following formula in the schedule:

- *Volume of Piles = Net length of Pile * π * (Pile Diameter / 2)* ^{2}

Adjust for the following as necessary:

- Nil.

4.3 STEEL H-PILES

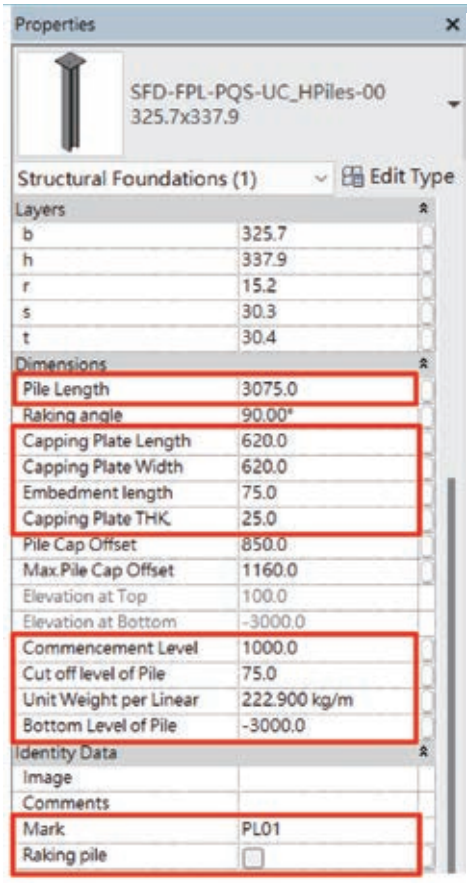
4.3.1 BASIC MODELLING APPROACHES

Based on the structural foundation template, create a loadable family type for each type and cross-sectional size of steel H-piles by extruding the specified cross-sectional dimensions and profile, and place the individual object in the designed location to the required top and bottom levels, which may vary depending on the design requirements and actual ground conditions.

Set the relevant steel H-pile dimensions as instance parameters to enable the adjustment of individual length, member size, raking angle, etc.

The existing ground or formation levels should be created in the model so that there are reference levels for placing the steel H-piles. When precise existing ground or formation levels are unavailable, tentative levels should be given.

The relevant information that can be extracted from the parameters includes cross-sectional size, length, depth, various levels, etc.



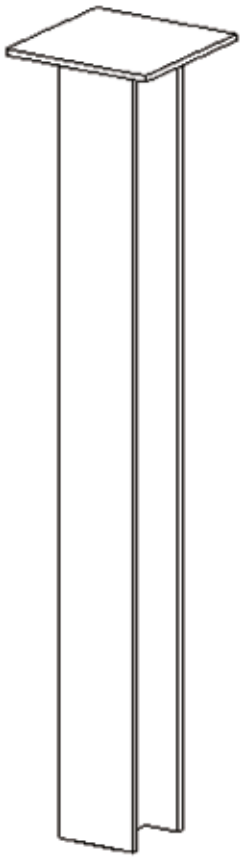


Fig 4.3.1 – 3D View of Steel H-Pile

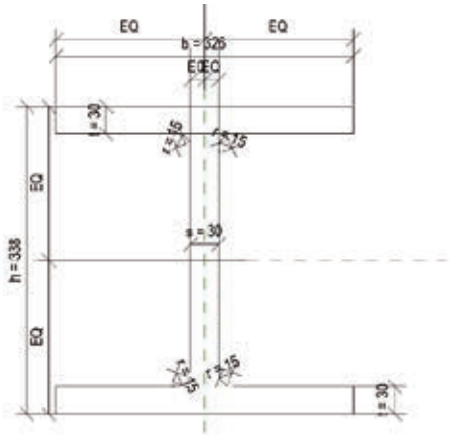

Fig 4.3.2 – Profile of Steel H-pile

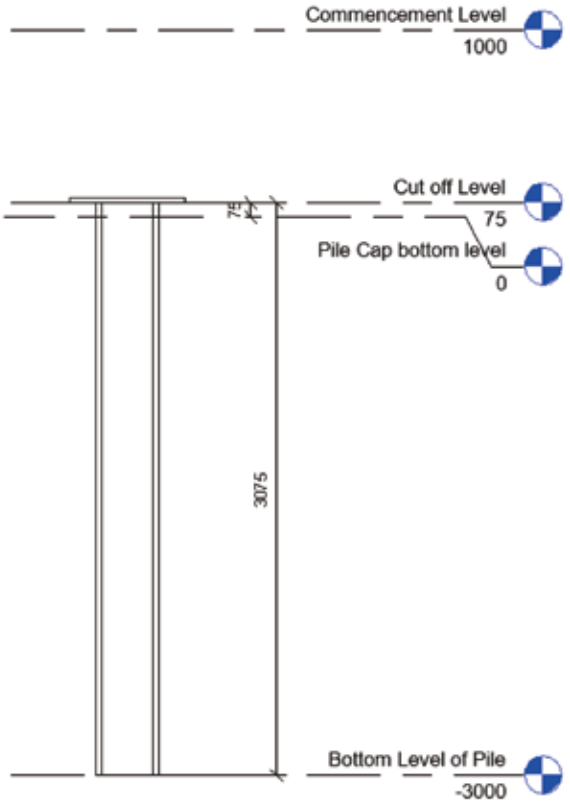

Fig 4.3.3 – Elevation view of Steel H-pile

4.3.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Steel H-pile marks.
2. Cross-sectional sizes and weights per unit length.
3. Commencement levels, cut-off levels and bottom levels of steel H-piles.
4. Pile head details.

This sample model has not included:

a. Pre-boring.
b. Drilling test.
c. Load tests.

4.3.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of steel H-piles, create a schedule with the following fields:

<Steel H-Piles Schedule>

A	B	C	D	E	F	G
Family	Type	Mark	Commencement Level	Cut off level of Pile	Bottom Level of Pile	Capping Plate Length
SFD-FPL-PQS-UC_HPiles-00	325.7x337.9	PL01	1000	75	-3000	620
SFD-FPL-PQS-UC_HPiles-00	325.7x337.9	PL02	1000	75	-3000	620
SFD-FPL-PQS-UC_HPiles-00	325.7x337.9	PL03	1000	75	-3000	620
SFD-FPL-PQS-UC_HPiles-00	325.7x337.9	PL04	1000	75	-3000	620
Grand total: 4						

H	I	J	K	L	M
Capping Plate Width	Pile Length	Embedment length	Unit Weight per Linear	Weight	Raking pile
620	3075	75	222.90 kg/m	685.42 kg	☐
620	3075	75	222.90 kg/m	685.42 kg	☐
620	3075	75	222.90 kg/m	685.42 kg	☐
620	3075	75	222.90 kg/m	685.42 kg	☐
				2741.67 kg	

Set the following formula in the schedule:

- *Weight (of Piles) = Pile Length / 1000 * Unit Weight per Linear (Length)*

Adjust for the following as necessary:

- Nil.

4.4 ROCK-SOCKETED STEEL H-PILES

4.4.1 BASIC MODELLING APPROACHES

Based on the structural foundations template, create a loadable family type for each type and cross-sectional size of rock-socketed steel H-piles by extruding the specified cross-sectional dimensions and profile, and place the individual object in the designed location to the required top and bottom levels, which may vary depending on the design requirements and actual ground conditions.

Set the relevant rock-socketed steel H-pile dimensions as instance parameters to enable the adjustment of individual length, member size, raking angle, etc.

The existing ground or formation levels should be created in the model so that there are reference levels for placing the rock-socketed steel H-piles. When precise existing ground or formation levels are unavailable, tentative levels should be given.

The relevant information that can be extracted from the parameters includes diameter, length, depth, various levels, etc.

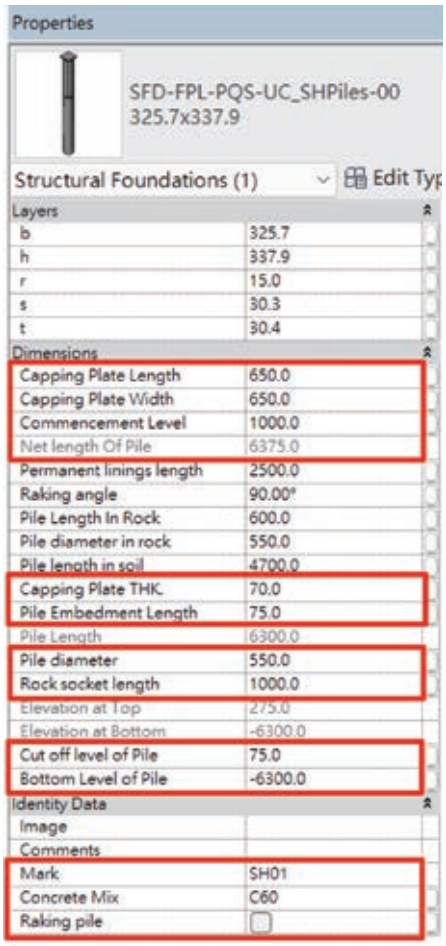

Fig 4.4.1 – 3D View of Rock-Socketed H-Pile

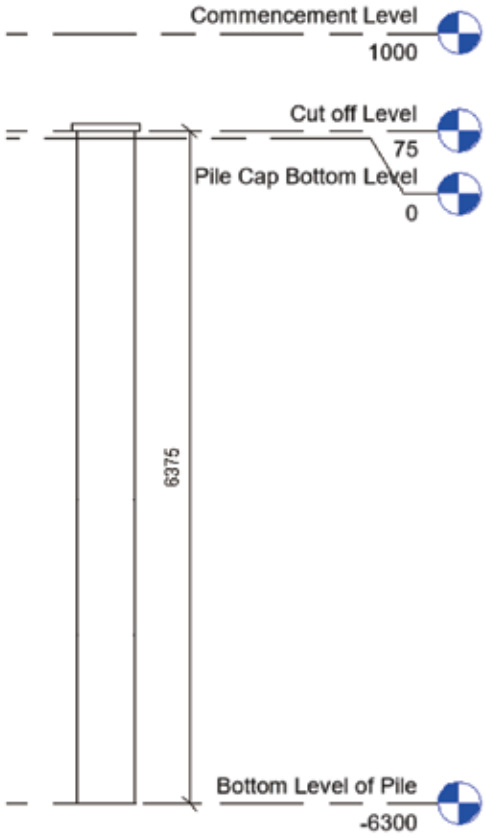

Fig. 4.4.2 – Elevation View of Rock-Socketed H-Pile

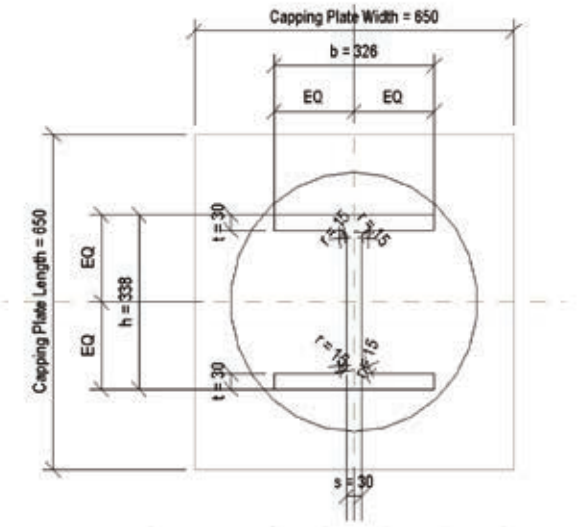

Fig. 4.4.3 – Plan View of Rock-Socketed H-Pile

4.4.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Rock-socketed steel H-pile marks.
2. Nominal diameters of sockets.
3. Commencing levels (which may be existing ground or formation levels), cut-off levels, top levels of bedrock and bottom levels of rock-socketed H-piles.
4. Internal diameters and thicknesses of permanent casings.
5. Mixes or strengths of concrete fillings to pile holes.
6. Socket lengths in bedrock.
7. Pile head details.

This sample model has not included:

a. Reinforcement to piles.
b. Pre-boring and drilling tests.
c. Load tests.

4.4.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of rock socketed steel H-piles, create a schedule with the following fields:

<Rock Socketed Steel H-Piles Schedule>

A	B	C	D	E	F	G	H	I
Family	Type	Mark	Concrete Mix	Pile diameter	Commencement Level	Cut off level of Pile	Bottom Level of Pile	Drilling Length
SFD-FPL-PQS-UC_SHPiles-00	325.7x337.9	SH01	C60	550	1000	75	-6300	7300

J	K	L	M	N
Permanent linings length	Pile Embedment Length	Rock socket length	Net length Of Pile	Raking pile
2500	75	1000	6375	☐

Set the following formula in the schedule:

- *Drilling Length = Commencement Level – Bottom Level of Pile*

Adjust for the following as necessary:

- Nil.

4.5 MINI-PILES

4.5.1 BASIC MODELLING APPROACHES

Based on the structural foundation templates, create a loadable family type for each type and cross-sectional size of mini-piles by extruding the specified cross-sectional dimensions and profile, and place the individual object in the designed location to the required top and bottom levels, which may vary depending on the design requirements and actual ground conditions.

Set the relevant mini-pile dimensions as instance parameters to enable the adjustment of individual length, diameter, raking angle, etc.

The existing ground or formation levels should be created in the model so that there are reference levels for placing the mini-piles. When precise existing ground or formation levels are unavailable, tentative levels should be given.

The relevant information that can be extracted from the parameters includes diameter, length, depth, various levels, etc.

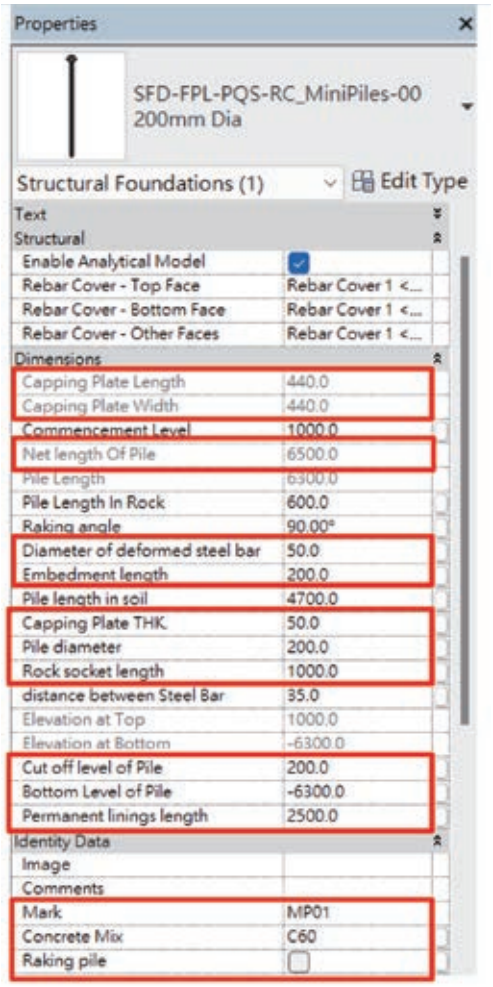

Fig. 4.5.1 – 3D View of Mini-Pile

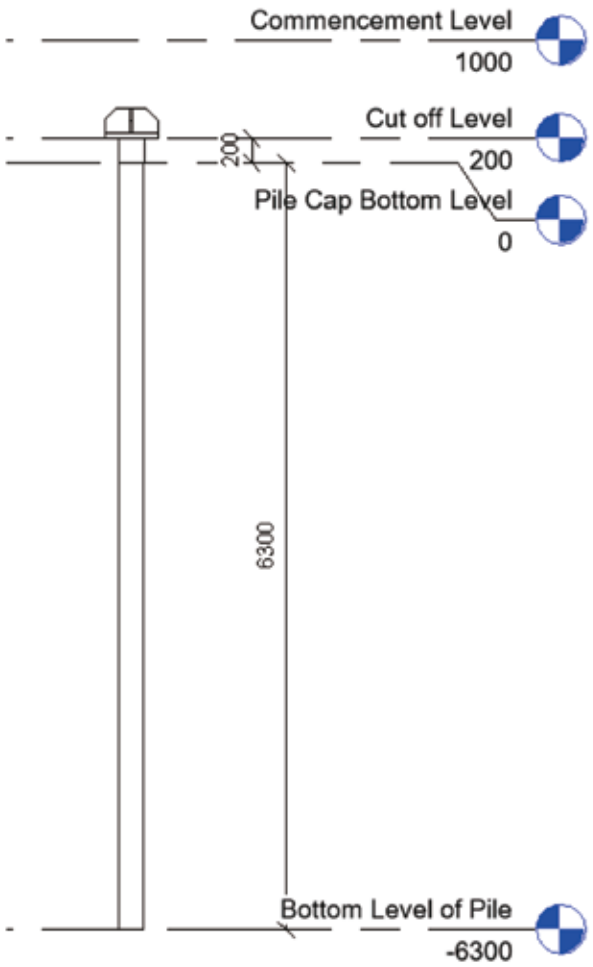

Fig. 4.5.2 – Elevation view of Mini-Pile

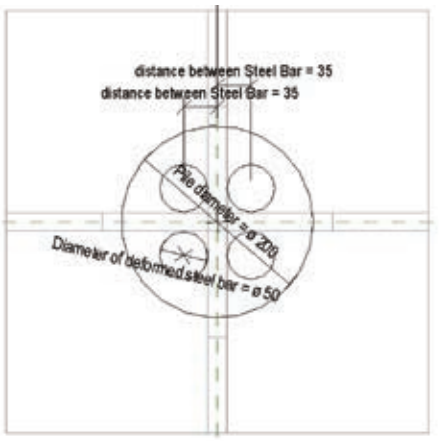

Fig. 4.5.3 – Plan View Of Mini-Pile

4.5.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Mini-pile marks.
2. Nominal diameters of piles.
3. Diameters of steel bars.
4. Commencing levels (which may be existing ground or formation level), cut-off levels, top levels of bedrock and bottom levels of mini-piles.
5. Internal diameters and thicknesses of permanent casings.
6. Mixes or strengths of concrete fillings to pile holes.
7. Socket lengths in bedrock.
8. Pile head details.

This sample model has not included:

a. Load tests.

4.5.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of mini-piles, create a schedule with the following fields:

<Mini Piles Schedule>

A	B	C	D	E	F	G	H	I
Family	Type	Mark	Concrete Mix	Commencement Level	Cut off level of Pile	Bottom Level of Pile	Drilling Length	Permanent linings length
SFD-FPL-PQS-RC_MiniPiles-00	200mm Dia	MP01	C50	1000	200	-6300	7300	2500

J	K	L	M	N	O
Embedment length	Rock socket length	Net length Of Pile	No. of Steel bars	Steel bar length	Raking pile
200	1000	6500	4	6500	

Set the following formula in the schedule:

- *Drilling Length = Commencement Level – Bottom Level of Pile*

Adjust for the following as necessary:

- Nil.

4.6 DIAPHRAGM WALLING

4.6.1 BASIC MODELLING APPROACHES

A diaphragm wall consists of two 3D segments: (1) panel lengths in soil and (2) panel lengths in rock.

Based on the structural foundations template, create a loadable family type for each type of “panel lengths in soil” by extruding the specified cross-sectional dimensions and profile, and place the individual object in the designed location to the required alignment and top and bottom levels, which may vary depending on the design requirements and actual ground conditions.

Set the cut-off level of the diaphragm wall panel as the top level of diaphragm wall panels. Set the panel width, thickness and length as instance parameters to enable the adjustment of individual dimensions where necessary.

Create the second 3D segment (i.e., panel length in rock (bedrock)) in the same way as the first segment.

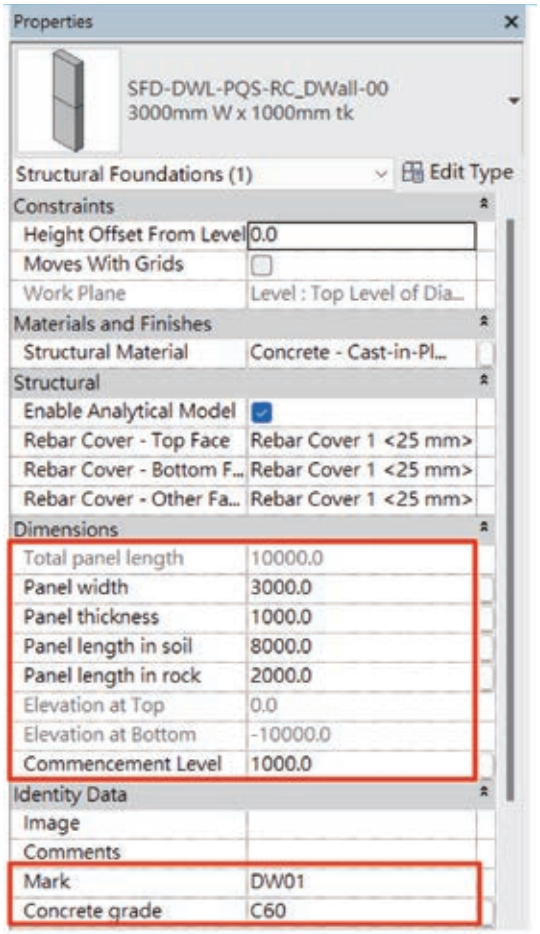
Lock the two segments together. Where there are corner or other non-standard panels, create separate loadable family types for them.

The existing ground or formation levels should be created or indicated so that there are reference levels for placing the guide walls and diaphragm wall panels.

Create guide walls separately based on the wall system family.

Unless otherwise designed or specified, excavation trenches for diaphragm wall panels are commenced at the bottom levels of guide walls (instead of the cut-off or top levels of panels).

The relevant information that can be extracted from the parameters includes thickness, length, depth, volume, etc.



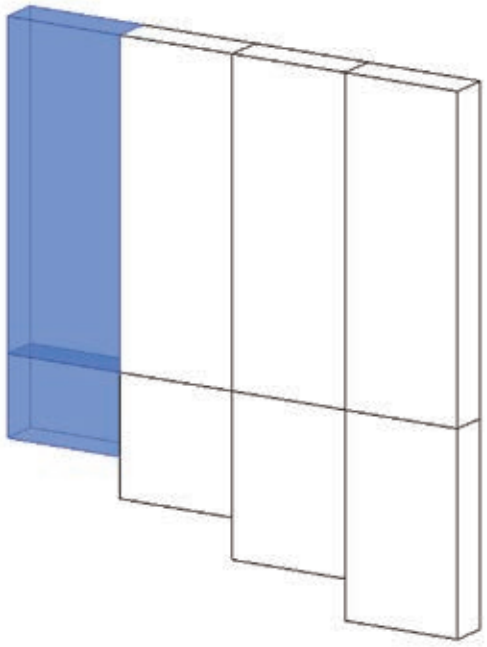


Figure 4.6.1 – 3D View of Diaphragm Wall

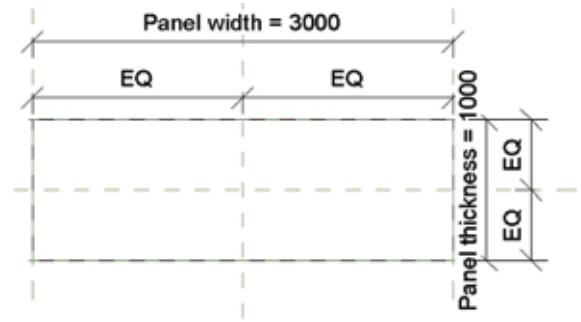

Figure 4.6.2 – Cross-Section View of Diaphragm Wall

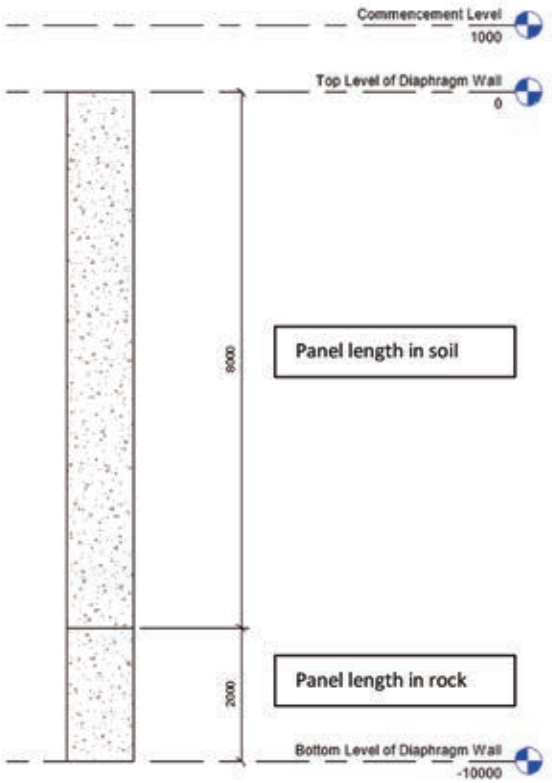

Figure 4.6.3 – Elevation of Diaphragm Wall

4.6.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Diaphragm wall marks.
2. Mixes or strengths of concrete.
3. Commencing levels for excavation of guide walls and diaphragm walls.
4. Dimensions of guide walls (if not modelled); required on one side or both sides.
5. Top levels of bedrock.

This sample model has not included:

a. Guide walls.
b. Reinforcement to diaphragm walls.
c. Waterproof joints between panels.
d. Pre- and post-construction drilling tests.
e. Temporary lateral supports.

4.6.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of diaphragm walling, create a schedule with the following fields:

<Diaphragm Wall Schedule>

A	B	C	D	E	F	G	H	I
Family	Type	Mark	Concrete grade	Commencement Level	Elevation at Bottom	Panel width	Panel thickness	Panel length in rock
SFD-DWL-PQS-RC_DWall-00	3000mm W x 1000mm tk	DW01	C60	1000	-10000	3000	1000	2000

J	K	L	M	N
Panel length in soil	Total panel length	Excavation Depth	Concrete Volume	Excavation Quantity
8000	10000	11000	30.00	33.00

Set the following formulae in the schedule:

- *Concrete volume = Panel width * Panel thickness * Panel length*
- *Excavation volume = Excavation depth * Panel width * Panel thickness*

Adjust for the following as necessary:

- Nil.

5.1 PILE CAPS

5.1.1 BASIC MODELLING APPROACHES

Based on the structural foundation templates, create a system family type for each type and thickness of pile caps, and place the individual object in the designed location to the required boundary / profile.

The relevant information that can be extracted from the parameters includes perimeter, (horizontal) area, volume, width, length, thickness (height), etc.

Model pile head embedment to cut through pile caps, i.e. the piles should take precedence over pile caps.

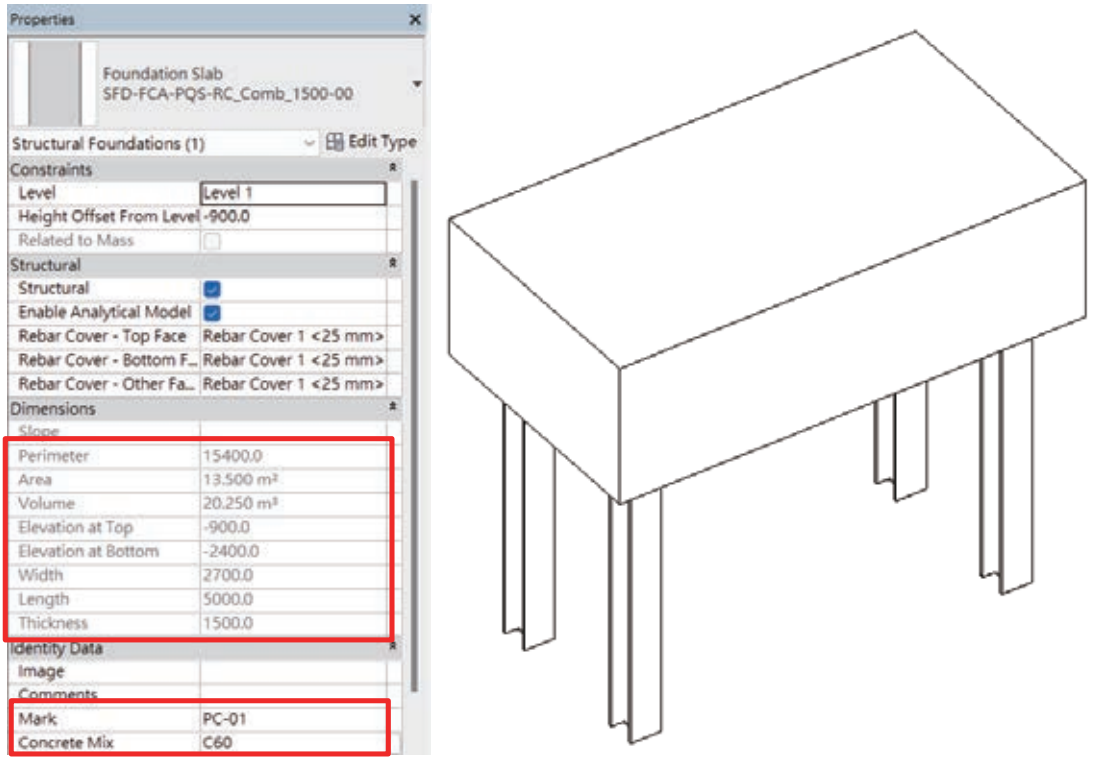

Figure 5.1.1 – 3D View of Pile Cap

5.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Pile cap marks.
2. Mixes or strengths of concrete.
3. Types and extents of specified admixtures (if any).
4. Formwork – left-in (if any).

This sample model has not included:

a. Reinforcement.
b. Formwork.

5.1.3 QUANTITY TAKE-OFF GUIDELINES

For the measurement of pile caps, create a schedule with the following fields:

<Pile Cap Schedule>

A	B	C	D	E	F	G	H	I
Family	Type	Mark	Concrete Mix	Perimeter	Thickness	Area	Volume	Pile Cap Side Fwk Area
Foundation Slab	SFD-FCA-PQS-RC_Comb_1500-00	PC-01	C60	15400	1500	13.50	20.25	23.10

Set the following formulae in the schedule:

- *Pile Cap Side Fwk Area = Perimeter * Thickness (depth of pile cap)*
- *Volume of blinding layer = Area * Thickness of blinding layer,* not shown above

Adjust for the following as necessary:

- Omit formwork at intersections of pile caps and other pile caps or footings.
- Omit areas of blinding layers overlapped with piles.

5.2 BASEMENT PERIMETER WALLS

5.2.1 BASIC MODELLING APPROACHES

Based on the structural walls template, create a system family type for each type and thickness of basement perimeter walls, and place the individual object in the designed location to the required alignment and top and base levels.

The relevant information that can be extracted from the parameters includes thickness, unconnected height (height), length, area, volume, etc. The parameter “area” may only be useful if the wall is a straight wall, otherwise, the area represents the largest area of the wall.

Model basement walls to cut through attached beams, slabs and staircases.

Generally, the structural top levels of the basement bottom slabs should be the base levels of the perimeter walls, and the structural top levels of the basement top slabs should be the top levels of the perimeter walls.

Set the corner wall joint method consistently as this will affect the allocation of wall type, concrete volume and formwork areas between different wall thicknesses joined together.

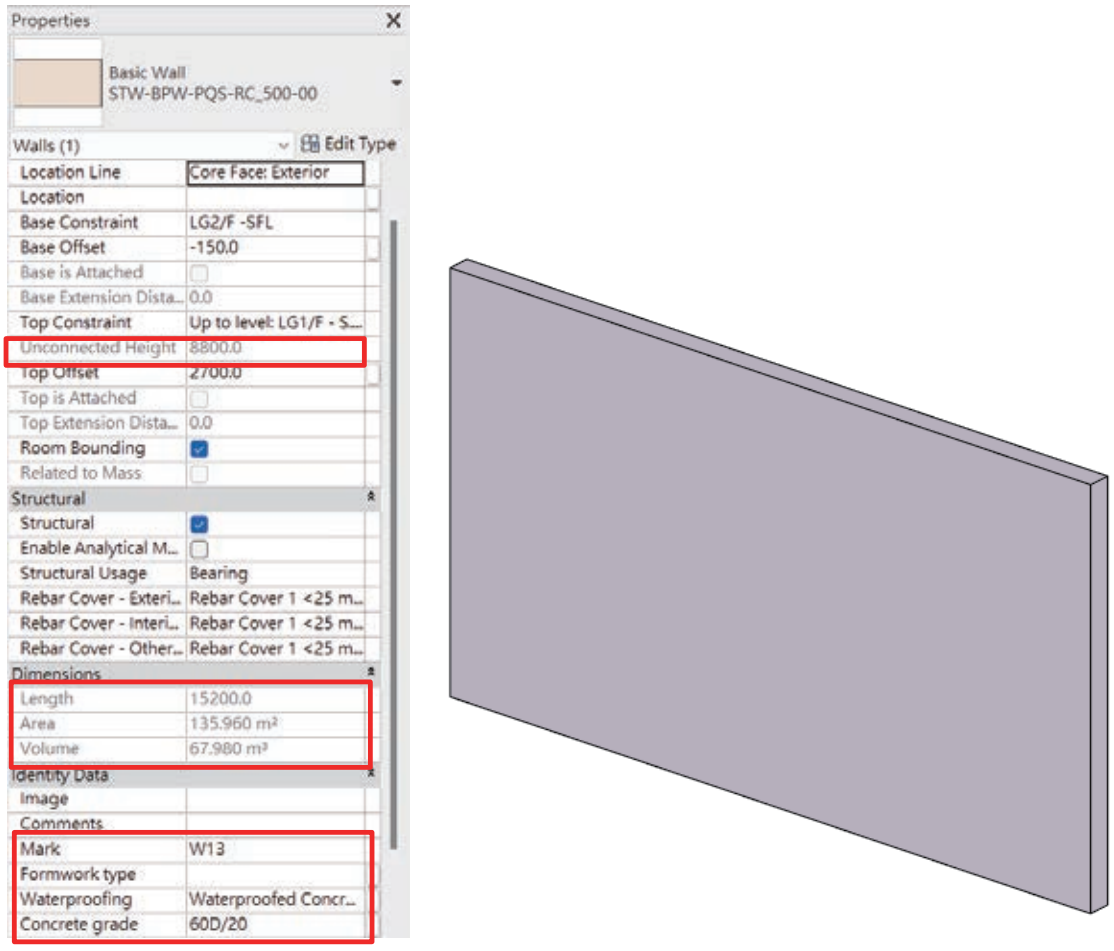

Figure 5.2.1 – 3D View of Basement Wall

5.2.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Wall marks.
2. Wall types – structural / retaining / vertical / sloping / curved.
3. Mixes or strengths of concrete.
4. Formwork type – left-in (if any).

This sample model has not included:

a. Reinforcement.
b. Formwork.

5.2.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of basement perimeter walls, create a schedule with the following fields:

<Structural Wall Schedule>

A	B	C	D	E	F	G	H	I
Family	Type	Mark	Waterproofing	Concrete grade	Width	Area	Volume	Fwk_Sides of wall
Basic Wall	STW-BPW-PQS-RC_500-00	W14	Waterproofed Concrete	60D/20	500	38.73	19.37	77.47
Basic Wall	STW-BPW-PQS-RC_500-00	W13	Waterproofed Concrete	60D/20	500	135.96	67.98	271.92
Basic Wall	STW-BPW-PQS-RC_500-00	W12	Waterproofed Concrete	60D/20	500	269.01	134.51	538.02

Set the following formulae in the schedule:

- *Fwk_Sides of wall = Area * 2*, only for straight walls without turns since Area = external face area.
- *Fwk_Sides of wall = Volume / Width (i.e. thickness) * 2*, more accurate based on average centre line area whether it is a straight or turned wall and whether it has varying widths or heights.

Adjust for the following as necessary:

- Omit formwork at intersections of walls with slabs, beams or columns as appropriate (except ends of beams and non-structural walls).
- Left-in formwork or one-sided formwork.

5.3 SUBSTRUCTURE COLUMNS

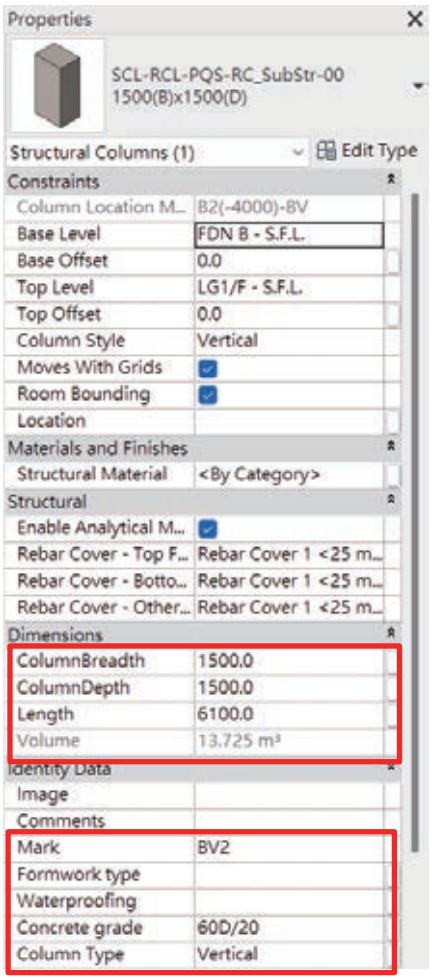
5.3.1 BASIC MODELLING APPROACHES

Based on the structural columns template, create a loadable family type for each type and cross-sectional size of substructure columns, and place the individual object in the designed location to the required top and base levels.

The relevant information that can be extracted from the parameters includes b (column breadth), h (column depth), length (column height), volume, etc.

Model columns to cut through attached beams, slabs and staircases, i.e. the column geometry should take precedence over them.

Generally, the base levels should be the structural top levels of the footings (or pedestals) on which the columns rest, and the top levels should be the structural top levels of the lowest floor slabs above.



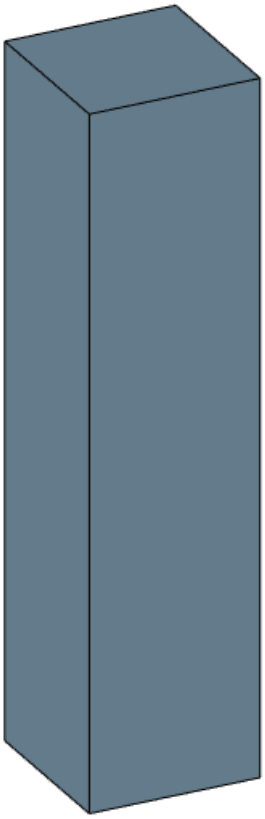


Figure 5.3.1 – 3D View of Substructure Column

5.3.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Column marks.
2. Column types – vertical or inclined (or slanted).
3. Mixes or strengths of concrete.
4. Shapes and cross-sectional sizes of columns
5. Types and extents of specified admixtures (if any).
6. Formwork type – left-in (if any).

This sample model has not included:

a. Reinforcement.
b. Formwork

5.3.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of substructure columns, create a schedule with the following fields:

<Structural Column Schedule>

A	B	C	D	E	F	G	H	I	J
Family	Type	Mark	Column Type	Concrete grade	Length	ColumnBreadth	ColumnDepth	Volume	Fwk_Sides of Column
SCL-RCL-PQS-RC_SubStr-00	1500(B)x1500(D)	BQ4	Vertical	60D/20	6100	1500	1500	13.73	36.60
SCL-RCL-PQS-RC_SubStr-00	1500(B)x1500(D)	BR4	Vertical	60D/20	6500	1500	1500	14.63	39.00
SCL-RCL-PQS-RC_SubStr-00	1500(B)x1500(D)	BS4	Vertical	60D/20	6500	1500	1500	14.63	39.00
SCL-RCL-PQS-RC_SubStr-00	1500(B)x1500(D)	BT4	Vertical	60D/20	6500	1500	1500	14.63	39.00
SCL-RCL-PQS-RC_SubStr-00	1500(B)x1500(D)	BU4	Vertical	60D/20	6500	1500	1500	14.63	39.00
SCL-RCL-PQS-RC_SubStr-00	1500(B)x1500(D)	BV4	Vertical	60D/20	6100	1500	1500	13.73	36.60
SCL-RCL-PQS-RC_SubStr-00	1500(B)x1500(D)	BQ3	Vertical	60D/20	6100	1500	1500	13.73	36.60
SCL-RCL-PQS-RC_SubStr-00	1500(B)x1500(D)	BR3	Vertical	60D/20	6100	1500	1500	13.73	36.60
SCL-RCL-PQS-RC_SubStr-00	1500(B)x1500(D)	BS3	Vertical	60D/20	6100	1500	1500	13.73	36.60
SCL-RCL-PQS-RC_SubStr-00	1500(B)x1500(D)	BT3	Vertical	60D/20	6100	1500	1500	13.73	36.60
SCL-RCL-PQS-RC_SubStr-00	1500(B)x1500(D)	BU3	Vertical	60D/20	6100	1500	1500	13.73	36.60
SCL-RCL-PQS-RC_SubStr-00	1500(B)x1500(D)	BV3	Vertical	60D/20	6100	1500	1500	13.73	36.60
SCL-RCL-PQS-RC_SubStr-00	1500(B)x1500(D)	BR2	Vertical	60D/20	6100	1500	1500	13.73	36.60
SCL-RCL-PQS-RC_SubStr-00	1500(B)x1500(D)	BS2	Vertical	60D/20	6100	1500	1500	13.73	36.60
SCL-RCL-PQS-RC_SubStr-00	1500(B)x1500(D)	BT2	Vertical	60D/20	6100	1500	1500	13.73	36.60
SCL-RCL-PQS-RC_SubStr-00	1500(B)x1500(D)	BU2	Vertical	60D/20	6100	1500	1500	13.73	36.60
SCL-RCL-PQS-RC_SubStr-00	1500(B)x1500(D)	BV2	Vertical	60D/20	6100	1500	1500	13.73	36.60
SCL-RCL-PQS-RC_SubStr-00	1200(B)x1200(D)	BW3	Vertical	60D/20	6100	1200	1200	8.78	29.28
Grand total: 18								245.71	661.08

Set the following formulae in the schedule:

- *Fwk_Sides of Column = Length * (ColumnBreadth + ColumnDepth) * 2*, for rectangular columns
- *Fwk_Sides of Column = Length* * π * ColumnDiameter, for round columns, not shown above

Note:

- Refer to Part C for how to set *ColumnBreadth and ColumnDepth* as schedulable shared parameters.

Adjust for the following as necessary:

- Omit formwork at intersections of columns with slabs or structural walls as appropriate.

5.4 SUBSTRUCTURE BEAMS

5.4.1 BASIC MODELLING APPROACHES

Substructure beams can be divided into ground beams, strap beams and tie beams.

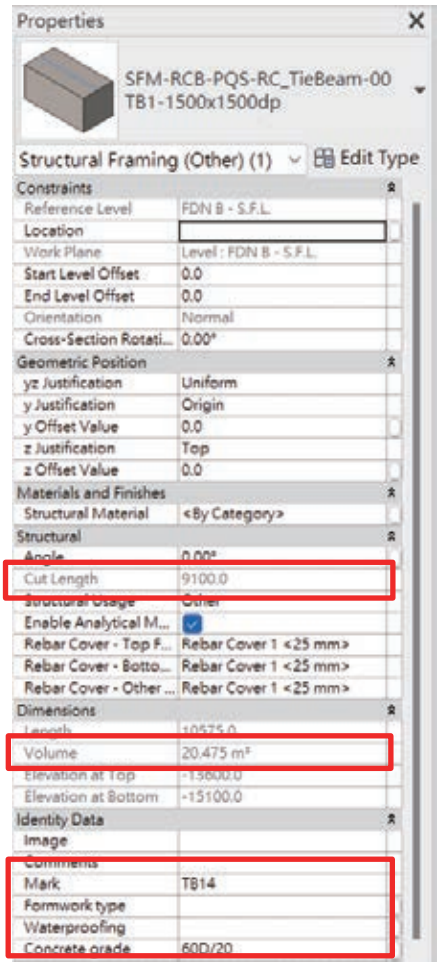
Based on the structural template, create a loadable family type for each type and cross-sectional size of ground beams, strap beams and tie beams, and place the individual object in the designed location to the required alignment and length.

The relevant information that can be extracted from the parameters includes b (beam width), h (beam depth), cut length (beam length), volume, etc.

Model substructure beams to be cut through by structural walls and columns.

The substructure beams should be modelled to the full structural size of the width and depth#.

#The submissions to the Buildings Department require slabs to be modelled between beams.



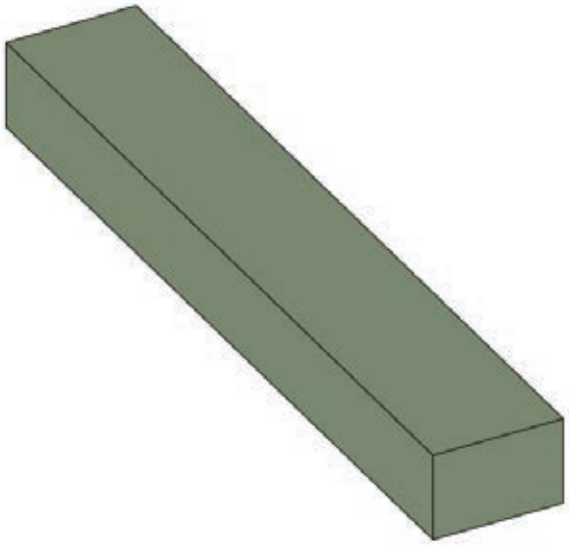


Figure 5.4.1 – 3D View of Substructure Beam

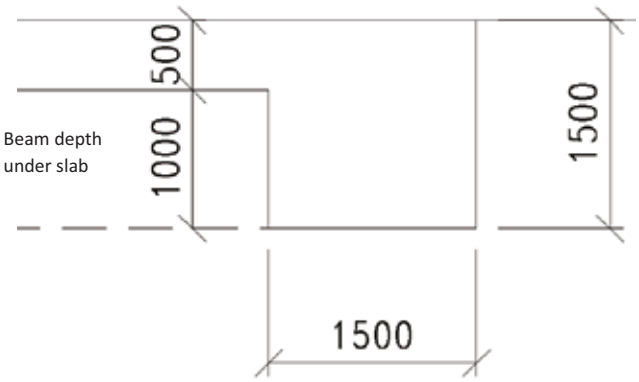

Figure 5.4.2 – Elevation of Substructure Beam

5.4.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Beam marks.
2. Beam types – ground beam / strap beam / tie beam / horizontal / sloping / curved / cranked / tapered.
3. Mixes or strengths of concrete.
4. Cross-sectional sizes of beams.
5. Types and extents of specified admixtures (if any).
6. Formwork type – left-in (if any).

This sample model has not included:

a. Blinding layer.
b. Reinforcement.
c. Formwork

5.4.3 QUANTITY TAKE-OFF GUIDELINES

For quantity take-off of on-grade substructure beams, create a schedule with the following fields:

<Structural Framing Schedule>

A	B	C	D	E	F	G	H	I	J
Family	Type	Mark	Concrete grade	Cut Length	BeamWidth	BeamDepth	Beam depth under slab	Volume	Fwk_Sides of Beam
SFM-RCB-PQS-RC_TieBeam-00	TB1-1500x1500dp	TB19	60D/20	6791	1500	1500	1000	15.28	16.98
SFM-RCB-PQS-RC_TieBeam-00	TB1-1500x1500dp	TB15	60D/20	4263	1500	1500	1000	9.11	10.66

SFM-RCB-PQS-RC_TieBeam-00	TB8-2000x1500dp	TB12	60D/20	3332	2000	1500	1000	10.00	8.33
SFM-RCB-PQS-RC_TieBeam-00	TB8-2000x1500dp	TB13	60D/20	3600	2000	1500	1000	10.80	9.00
SFM-RCB-PQS-RC_TieBeam-00	TB8-2000x1500dp (CAN)	TB06	60D/20	1241	2000	1500	1000	3.72	3.10
SFM-RCB-PQS-RC_TieBeam-00	TB8-2000x1500dp (CAN)	TB07	60D/20	1241	2000	1500	1000	3.72	3.10
SFM-RCB-PQS-RC_TieBeam-00	TB8-2000x1500dp (CAN)	TB08	60D/20	1241	2000	1500	1000	3.72	3.10
SFM-RCB-PQS-RC_TieBeam-00	TB8-2000x1500dp (CAN)	TB09	60D/20	1000	2000	1500	1000	3.00	2.50
Grand total: 24								357.38	295.55

For volume of beam, set the following formulae in the schedule:

- *Volume (of Beam) (m3) = Cut Length * BeamWidth * BeamDepth.*

For an edge beam as illustrated in Figure 5.4.2, set the following formulae in the schedule:

- *Fwk_Sides of Beam (m2) = Cut Length * (BeamDepth + BeamDepth under slab).*

For beams with slab concrete cast between beams, set the following formulae in the schedule:

- *Fwk_Sides of Beam (m2) = Cut Length * (BeamDepth under slab*2).*

Note:

- Refer to Part C for how to set *BeamDepth (h)* and *BeamWidth (b)* as schedulable shared parameters, otherwise they are not obtainable using Schedule by default.

Adjust for the following as necessary:

- Omit formwork at intersections of beams with slabs or structural walls as appropriate (except ends of beams).

5.5 SUBSTRUCTURE SLABS

5.5.1 BASIC MODELLING APPROACHES

Substructure slabs (called “floors” in Revit) can be divided into basement slabs, on-grade slabs and suspended slabs. All slabs can be built up based on existing structural floors families.

Create a system family type for each type and thickness of substructure slabs, and place the individual object in the designed location to the required boundary.

The relevant information that can be extracted from the parameters includes perimeter, thickness, area, volume, etc.

Substructure slab is defined as horizontal element. The slab is bounded by beams or vertical elements (e.g., structural columns and walls).

Model substructure slabs to be cut through by beams#, walls and columns.

#The submissions to the Buildings Department require slabs to be modelled between beams.

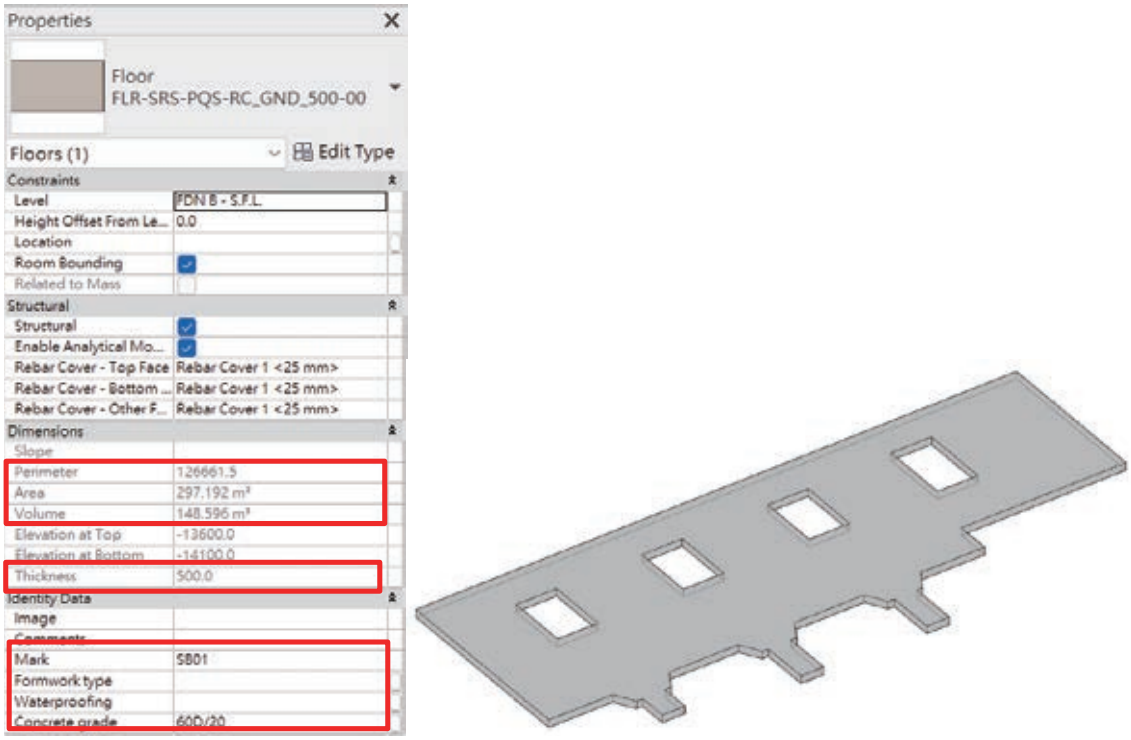

Figure 5.5.1 – 3D View of Substructure Slab

5.5.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Slab marks.
2. Slab types – suspended / on-grade / ground slab / sloping.
3. Mixes or strengths of concrete.
4. Thickness of slabs.
5. Types and extents of specified admixtures (if any).
6. Formwork – left-in (if any).

This sample model has not included:

a. Blinding layer.
b. Hardcore bed and building paper.
c. Reinforcement.
d. Formwork.

5.5.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of substructure slabs, create a schedule with the following fields:

<Floor Schedule>

A	B	C	D	E	F	G	H	I
Family	Type	Mark	Concrete grade	Perimeter	Thickness	Area	Volume	Fwk_Sides of Slab
Floor	FLR-SRS-PQS-RC_GND_500-00	SB01	60D/20	126662	500	297.19	148.60	63.33
Floor	FLR-SRS-PQS-RC_GND_500-00	SB02	60D/20	142696	500	297.55	148.78	71.35
Grand total: 2							297.37	134.68

Set the following formula in the schedule:

- *Fwk_Sides of Slab (i.e., area of edges of slabs) = Thickness (i.e. height) * Perimeter*

Adjust for the following as necessary:

- Omit formwork at intersections of slabs with structural walls and columns, beams, footings or pile caps as appropriate.

SECTION 6 – RC SUPERSTRUCTURE

6.1 STRUCTURAL COLUMNS

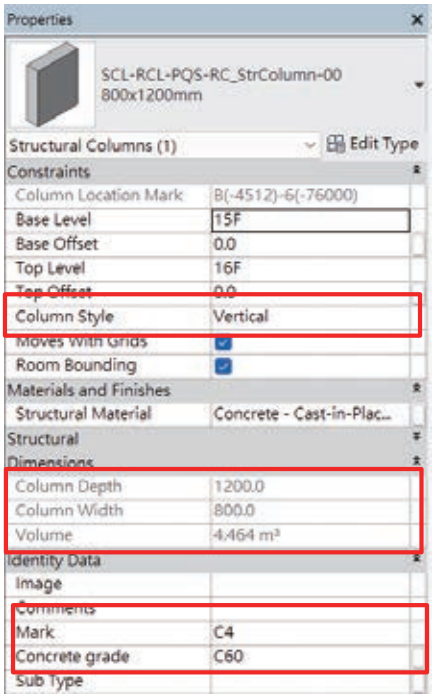
6.1.1 BASIC MODELLING APPROACHES

Based on the structural columns template, create a loadable family type for each type and cross-sectional size of structural columns, and place the individual object in the designed location to the required top and base levels.

The relevant information that can be extracted from the parameters includes b (column width), h (column depth), length (column height), volume, etc.

Model columns to cut through attached beams, slabs and staircases, but not to cut through transfer slabs and beams.

Generally, the structural floor levels should be used as the top levels of columns below and the base levels of columns above, except that the base levels of transfer slabs and beams should be used as the top levels of columns below.



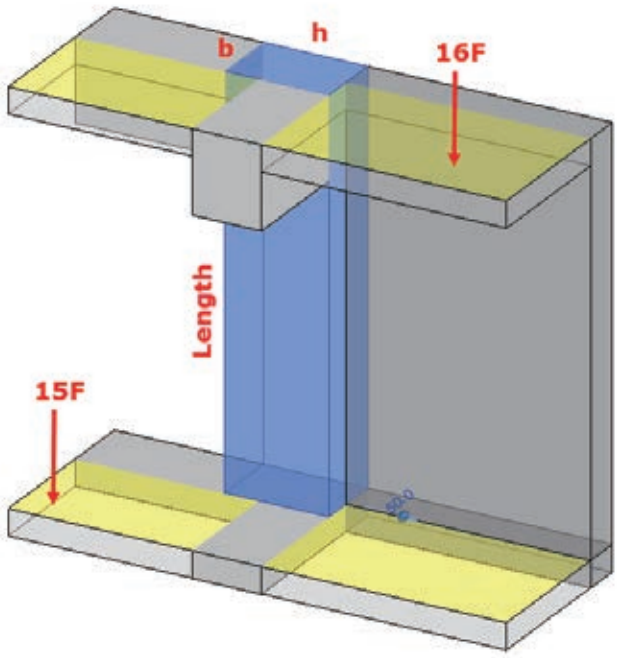


Figure 6.1.1 – 3D View of Structural Column

6.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Column marks.
2. Column types – structural / vertical / sloping / rectangular / circular.
3. Mixes or strengths of concrete.
4. Cross-sectional sizes of columns.
5. Types and extents of specified admixtures (if any).
6. Formwork – left-in (if any).

This sample model has not included:

a. Reinforcement.
b. Formwork.

6.1.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of structural columns, create a schedule with the following fields:

<Structural Column Schedule>

A	B	C	D	E	F	G	H	I
Family	Type	Mark	Concrete grade	Column Depth	Column Width	Length	Volume	Fwk_Sides of Column
SCL-RCL-PQS-RC_StrColumn-00	800x1200mm	C1	C60	1200	800	4650	4.46	18.60
SCL-RCL-PQS-RC_StrColumn-00	800x1200mm	C2	C60	1200	800	4650	4.46	18.60
SCL-RCL-PQS-RC_StrColumn-00	800x1200mm	C3	C60	1200	800	4650	4.46	18.60
SCL-RCL-PQS-RC_StrColumn-00	800x1200mm	C4	C60	1200	800	4650	4.46	18.60
SCL-RCL-PQS-RC_StrColumn-00	800x1200mm	C5	C60	1200	800	4650	4.46	18.60
SCL-RCL-PQS-RC_StrColumn-00	800x1200mm	C6	C60	1200	800	4650	4.46	18.60
SCL-RCL-PQS-RC_StrColumn-00	800x1200mm	C7	C60	1200	800	4650	4.46	18.60
SCL-RCL-PQS-RC_StrColumn-00	800x1200mm	C8	C60	1200	800	4650	4.46	18.60
Grand total: 8							35.71	148.80

Set the following formulae in the schedule:

- *Fwk_Sides of Column = Length * (Column Width + Column Depth) * 2*, for rectangular columns
- *Fwk_Sides of Column = Length * π * Column Diameter*, for round columns not shown above

Note:

- Refer to Part C for how to set *Column Width* and *Column Depth* as schedulable shared parameters.

Adjust for the following as necessary:

- Omit formwork at intersections of columns with slabs, beams or structural walls as appropriate (except ends of beams).

6.2 STRUCTURAL WALLS

6.2.1 BASIC MODELLING APPROACHES

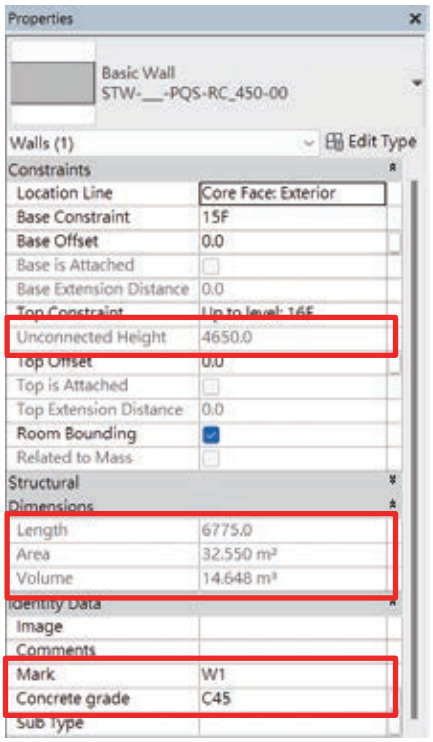
Based on the structural walls template, create a system family type for each type and thickness of structural walls, and place the individual object in the designed location to the required alignment and top and base levels.

The relevant information that can be extracted from the parameters includes length, width (thickness), unconnected height (height), area, volume, etc.

Model structural walls to cut through attached beams, slabs and staircases, but not to cut through transfer slabs and beams.

Generally, the structural floor levels should be used as the top levels of structural walls below and the base levels of structural walls above, except that the base levels of transfer slabs and beams should be used as the top levels of structural walls below.

Set the corner wall joint method consistently as this will affect the allocation of concrete volume and formwork areas between different wall thicknesses joined together.



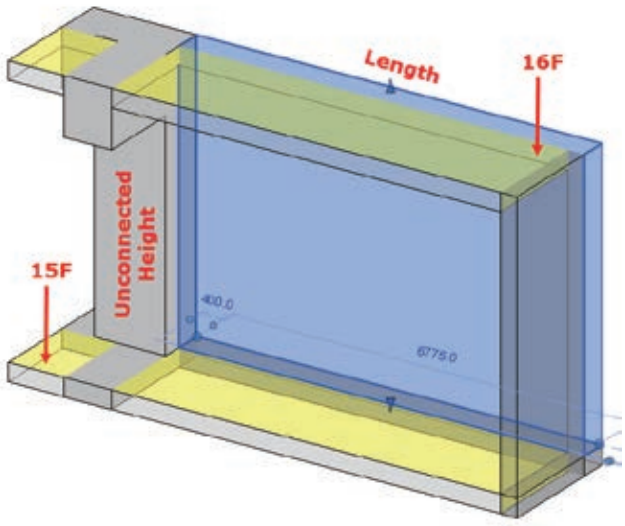


Figure 6.2.1 – 3D View of Structural Wall

6.2.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Wall marks.
2. Wall types – structural / retaining / vertical / sloping / curved.
3. Mixes or strengths of concrete.
4. Wall thicknesses.
5. Types and extents of specified admixtures (if any).
6. Formwork – left-in (if any).

This sample model has not included:

a. Reinforcement.

b. Formwork.

6.2.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of structural walls, create a schedule with the following fields:

<Wall Schedule>

A	B	C	D	E	F	G	H	I
Family	Type	Mark	Concrete grade	Width	Length	Area	Volume	Fwk_Both sides of Wall
Basic Wall	STW-___-PQS-RC_450-00	W1	C45	450	6775	32.55	14.65	65.10
Basic Wall	STW-___-PQS-RC_450-00	W2	C45	450	6350	29.53	13.29	59.06
Basic Wall	STW-___-PQS-RC_450-00	W3	C45	450	6775	30.46	13.71	60.92
Basic Wall	STW-___-PQS-RC_450-00	W4	C45	450	6775	32.55	14.65	65.10
Basic Wall	STW-___-PQS-RC_450-00	W5	C45	450	6350	29.53	13.29	59.06
Basic Wall	STW-___-PQS-RC_450-00	W6	C45	450	6775	30.46	13.71	60.92
Grand total: 6							83.28	370.14

Set the following formulae in the schedule:

- *Fwk_Both sides of Wall = Area * 2*, only for straight walls without turns since Area = external face area
- *Fwk_Both sides of Wall = Volume / Width (i.e., thickness) * 2*, more accurate based on average centre line area whether it is a straight or turned wall and whether it has varying widths or heights

Adjust for the following as necessary:

- Omit formwork at intersections of walls with slabs, beams or columns as appropriate (except ends of beams and non-structural walls).
- Edges, breaks and ends of walls.

6.3 STRUCTURAL BEAMS

6.3.1 BASIC MODELLING APPROACHES

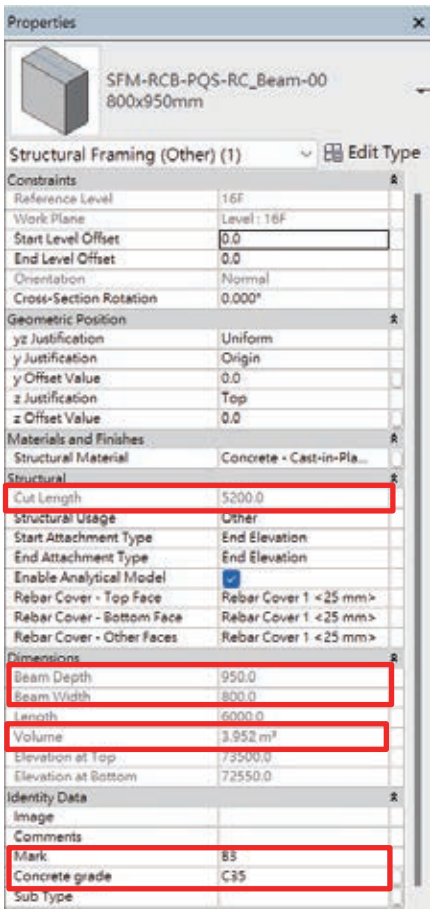
Based on the structural framings template, create a loadable family type for each type and cross-sectional size of beams, and place the individual object in the designed location to the required alignment and length.

The relevant information that can be extracted from the parameters includes cut length (beam length), b (beam width), h (beam depth), volume, etc.

Model beams to be cut through by structural walls and columns.

The structural beams should be modelled to the full structural size of the width and depth#.

#The submissions to the Buildings Department require slabs to be modelled between beams.



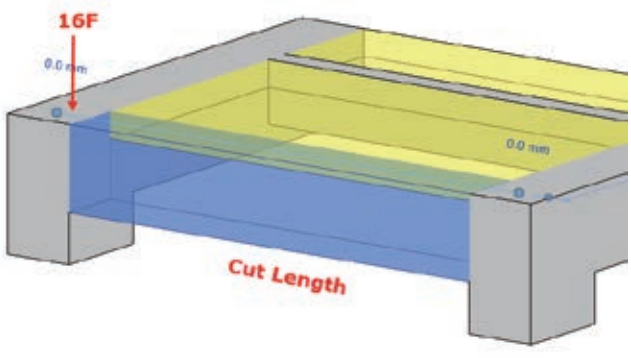


Figure 6.3.1 – 3D View of Beam

6.3.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Beam marks.
2. Beam types – horizontal / sloping / curved / cranked / tapered / upstand / transfer beam / tie beam.
3. Mixes or strengths of concrete.
4. Cross-sectional sizes of beams.
5. Types and extents of specified admixtures (if any).
6. Formwork – left-in (if any).

This sample model has not included:

a. Reinforcement.

b. Formwork.

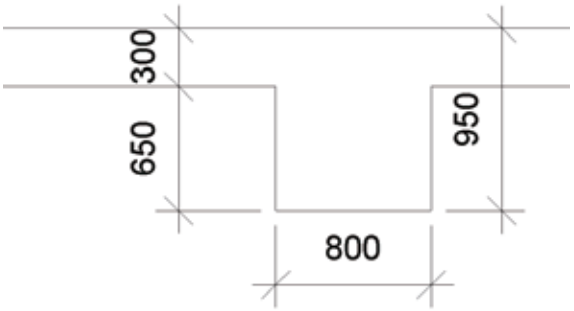
6.3.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of beams, create a schedule with the following fields:

<Structural Framing Schedule>

A	B	C	D	E	F	G	H	I	J
Family	Type	Mark	Concrete grade	Cut Length	Beam Width	Beam Depth	Beam depth under slab	Volume	Fwk_Sides & Soffit
SFM-RCB-PQS-RC_Beam-00	800x950mm	B1	C35	4800	800	950	650	3.65	10.08
SFM-RCB-PQS-RC_Beam-00	800x950mm	B2	C35	4800	800	950	650	3.65	10.08
SFM-RCB-PQS-RC_Beam-00	800x950mm	B3	C35	5200	800	950	650	3.95	10.92
SFM-RCB-PQS-RC_Beam-00	800x1550mm	B4	C35	5200	800	1550	1250	6.45	17.16
SFM-RCB-PQS-RC_Beam-00	300x700mm	B5	C35	5200	300	700	400	1.09	5.72
SFM-RCB-PQS-RC_Beam-00	800x950mm	B6	C35	4800	800	950	650	3.65	10.08
SFM-RCB-PQS-RC_Beam-00	800x950mm	B7	C35	4800	800	950	650	3.65	10.08
SFM-RCB-PQS-RC_Beam-00	800x950mm	B8	C35	5200	800	950	650	3.95	10.92
SFM-RCB-PQS-RC_Beam-00	800x1550mm	B9	C35	5200	800	1550	1250	6.45	17.16
SFM-RCB-PQS-RC_Beam-00	300x700mm	B10	C35	5200	300	700	400	1.09	5.72
Grand total: 10								37.58	107.92

Beam depth under slab



Set the following formulae in the schedule:

For volume of beam:

- *Volume (of Beam) (m3) = Cut Length * BeamWidth * BeamDepth.*

For formwork to beam:

- *Beam depth under slab = Beam Depth – Slab Thickness*, where Slab Thickness, not shown in the above schedule, is a field entered manually
- *Fwk_Sides & Soffit = Cut Length * (Beam Depth under slab* 2 + Beam Width)*

Note:

- Refer to Part C for how to set *Beam Width* and *Beam Depth* as schedulable shared parameters.
- There is an alternative rule under HKSMM5 that the volumes of slabs and beams can be measured and grouped together if they are of the same mix or strength. The alternative rule applies only if expressly so stated.

Adjust for the following as necessary:

- Omit formwork at intersections of beams with slabs or structural walls as appropriate (except ends of beams).

6.4 STRUCTURAL SLABS

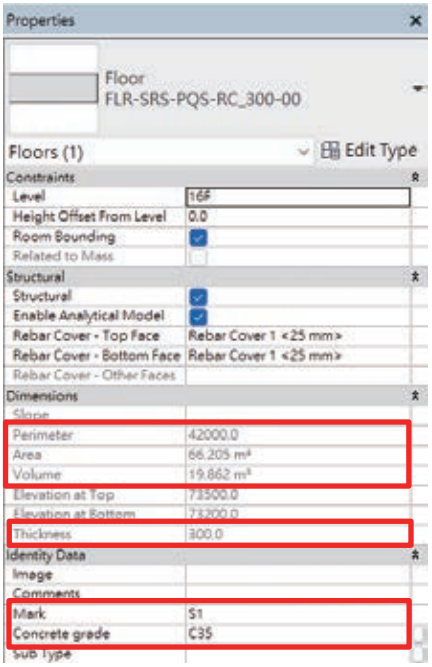
6.4.1 BASIC MODELLING APPROACHES

Based on the structural floors template, create a system family type for each type and thickness of slabs, and place the individual object in the designed location to the required boundary.

The relevant information that can be extracted from the parameters includes perimeter, thickness, area, volume, etc.

Model slabs to be cut through by beams#, walls and columns.

#The submissions to the Buildings Department require slabs to be modelled between beams.



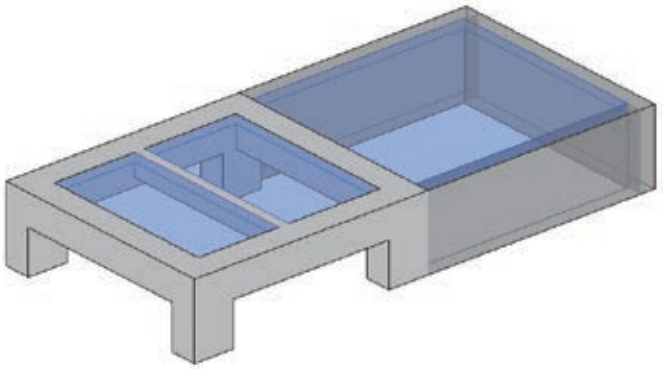


Figure 6.4.1 – 3D View of Slabs

6.4.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Slab marks.
2. Slab types – suspended / sloping / curved.
3. Thickness of slabs.
4. Mixes or strengths of concrete.
5. Types and extents of specified admixtures (if any).
6. Formwork – left-in (if any).

This sample model has not included:

a. Reinforcement.
b. Formwork.

6.4.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of slabs, create a schedule with the following fields:

<Floor Schedule>

A	B	C	D	E	F	G	H	I
Family	Type	Mark	Concrete grade	Thickness	Perimeter	Area	Volume	Fwk_Soffit of Slab
Floor	FLR-SRS-PQS-RC_300-00	S1	C35	300	42000	66.21	19.86	66.21
Floor	FLR-SRS-PQS-RC_300-00	S2	C35	300	42000	66.21	19.86	66.21
Grand total: 2							39.72	132.41

Set the following formula in the schedule:

- *Fwk_Soffit of Slab = Area*

Note:

- HKSMM5 stipulates that slab concrete volumes are measured across beams. According to the above modelling approach, the default parameters Volume and Area of slabs do not include the portions over beams. Adjustments of Volume to give slab concrete volume are required to follow the HKSMM5 rules.
- There is an alternative rule in the HKSMM5 that the volumes of slabs and beams may be measured and grouped together if they are of the same mix or strength. The alternative rule applies only if expressly so stated.

Adjust for the following as necessary:

- Omit formwork at intersections of slabs with columns, structural walls or beams as appropriate (except ends of beams and non-structural walls).
- Add formwork to edges and breaks in slabs if required.

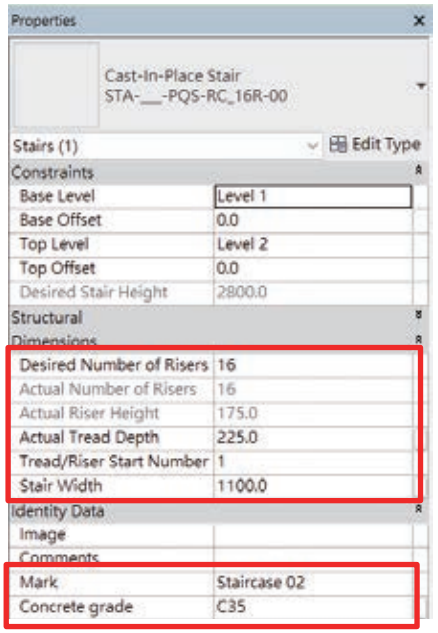
6.5 STAIRCASES

6.5.1 BASIC MODELLING APPROACHES

Based on the stairs template, create a system family type for each type and cross-sectional size of staircases, and place the individual object in the designed location to the required length and top and base levels.

The relevant information that can be extracted from the parameters includes actual number of risers, actual riser height, actual tread width, etc.

Create In-place models to complete the connections to structural elements.



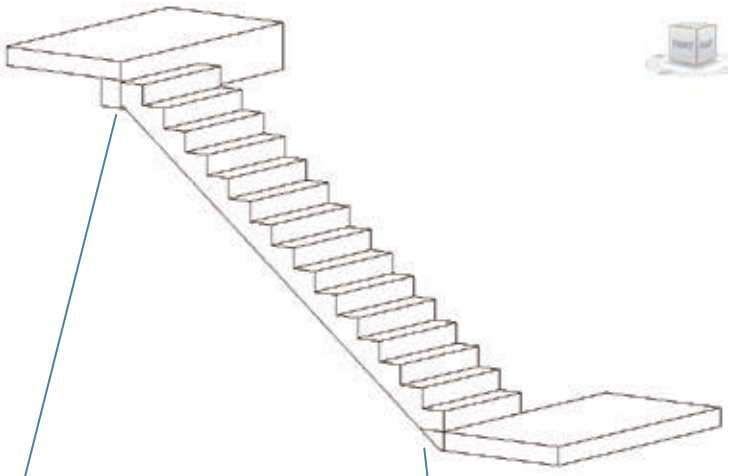


Figure 6.5.1 – 3D View of Staircase 02

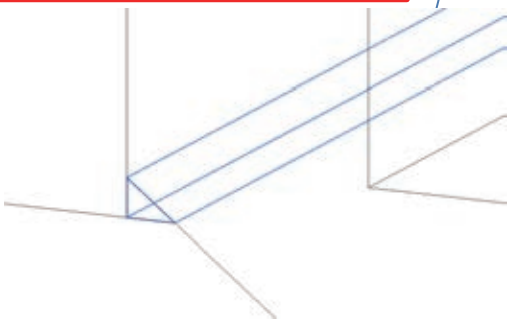
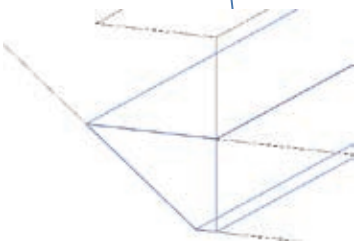


Stair Connection 01



Stair Connection 02

6.5.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Staircase marks.
2. Staircase types.
3. Mixes or strengths of concrete.
4. Formwork – left-in (if any).

This sample model has not included:

a. Reinforcement.
b. Formwork.

6.5.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of concrete staircases, create a material take-off schedule with the following fields (refer to Part C for how to create material take-off schedules):

<Stairs Conc. Volume>

A	B	C	D	E
Family	Type	Mark	Concrete grade	Material: Volume
Cast-In-Place Stair	STA-___-PQS-RC_16R-00	Staircase 02	C35	1.00

For measurement of the in-place models of stair connections, create a schedule with the following fields:

<Stair Connection Schedule>

A	B
Family	Volume
Stair connection 01	0.001
Stair connection 02	0.025

For measurement of formwork to open strings and soffits of stairs, use the “Paint” tool to assign different material surfaces.

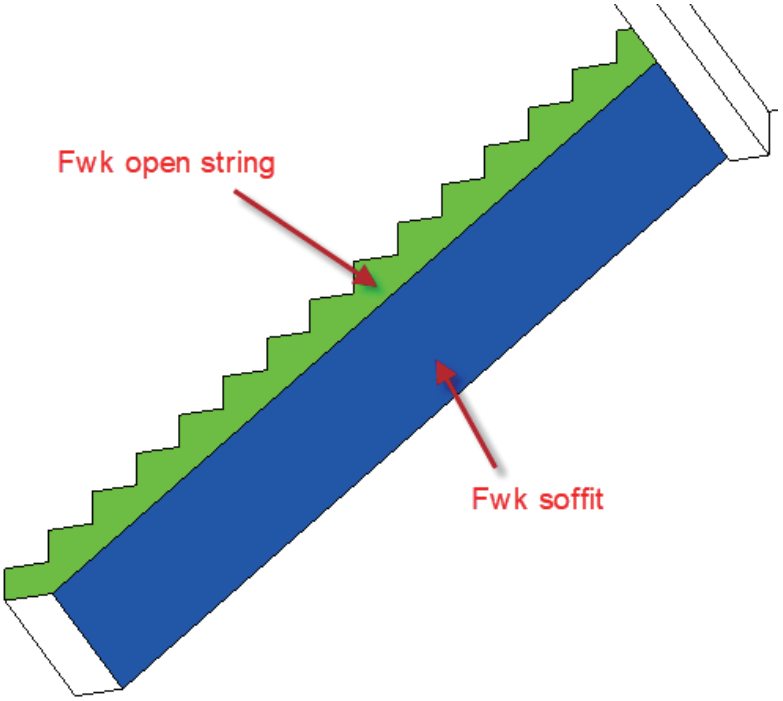


Figure 6.5.2 – 3D View of Staircase 01

After using the Paint tool, create a material take-off schedule with the following fields (refer to Part C for how to create material take-off schedules):

<Stairs - Formwork>

A	B	C	D	E
Family	Type	Mark	Material: Name	Material: Area
Cast-In-Place Stair	STA-___-PQS-RC_16R-00	Staircase 01	Fwk open string	0.91
Cast-In-Place Stair	STA-___-PQS-RC_16R-00	Staircase 01	Fwk soffit	4.36

For measurement of formwork to risers of stairs, create a schedule with the following fields:

<Stair - Formwork Schedule>

A	B	C	D	E	F	G
Family	Type	Mark	Actual Riser Height	Actual Number of Risers	Stair Width	Fwk_Riser of Stair
Cast-In-Place Stair	STA-___-PQS-RC_16R-00	Staircase 02	175	16	1100	2.89

Set the following formula in the schedule:

- *Fwk_Riser of Stair (area) = (Actual Number of Risers – 1) * Stair Width * Actual Riser Height*, 1 riser subtracted when the upper landing edge is modelled as 1 riser

Note:

- Open string and riser measured in m^2; formwork ≤ 300mm or > 300mm high should be stated separately according to HKSMM5.

Adjust for the following as necessary:

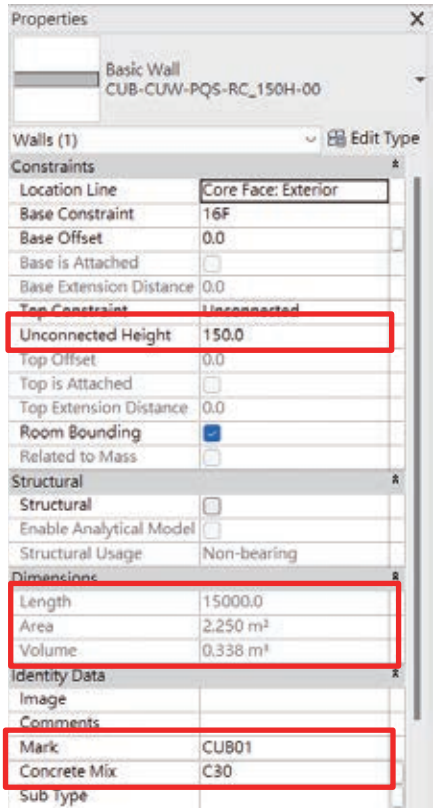
- Nil.

6.6 CURBS

6.6.1 BASIC MODELLING APPROACHES

Based on the walls template, create a system family type for each type and thickness of curbs, and place the individual object in the designed location to required alignment, length and height.

The relevant information that can be extracted from the parameters includes length, width, unconnected height (height), area, volume, etc.



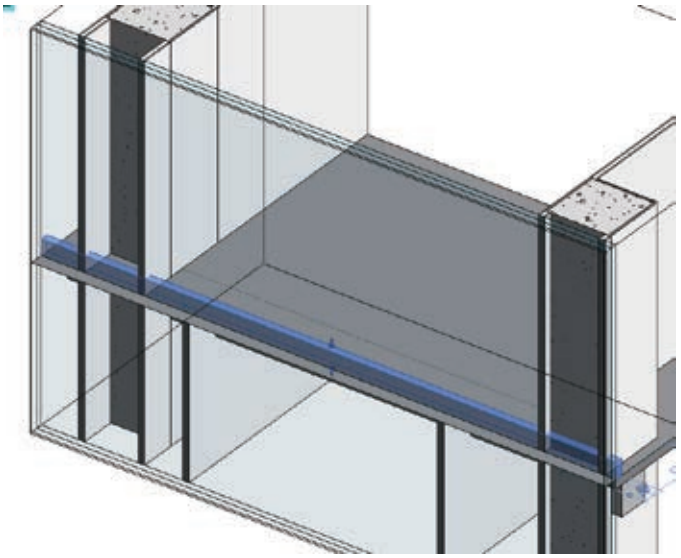


Figure 6.6.1 – 3D View of Curb

6.6.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Curb marks.
2. Mixes or strengths of concrete.

This sample model has not included:

a. Reinforcement.

b. Formwork.

6.6.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of curbs, create a schedule with the following fields:

<Curb Schedule>

A	B	C	D	E
Family	Type	Mark	Concrete Mix	Volume
Basic Wall	CUB-CUW-PQS-RC_150H-00	CUB03	C30	0.06
Basic Wall	CUB-CUW-PQS-RC_150H-00	CUB02	C30	0.17
Basic Wall	CUB-CUW-PQS-RC_150H-00	CUB01	C30	0.34
Grand total: 3				0.56

<Curb - Formwork - Sides of curbs>

A	B	C	D	E	F	G
Family	Type	Mark	Unconnected Height	Length	Area	Formwork - Sides of curbs
Basic Wall	CUB-CUW-PQS-RC_150H-00	CUB03	150	2500	0.38	0.75
Basic Wall	CUB-CUW-PQS-RC_150H-00	CUB02	150	7600	1.14	2.28
Basic Wall	CUB-CUW-PQS-RC_150H-00	CUB01	150	15000	2.25	4.50
Grand total: 3						7.53

Set the following formula in the schedule:

- *Formwork – Sides of curbs (area) = Length * Unconnected Height* 2*, or
- *Formwork – Sides of curbs (area) = Area * 2*

Note

- Measured in m^2; formwork ≤ 300mm or > 300mm high should be stated separately according to HKSMM5.

Adjust for the following as necessary:

- Nil.

6.7 LINTELS (NORMALLY THIS WILL NOT BE MODELLED)

6.7.1 BASIC MODELLING APPROACHES

Based on the walls template, create a system family type for each type and cross-sectional size of lintels, and place the individual object in the designed location to the required alignment and length.

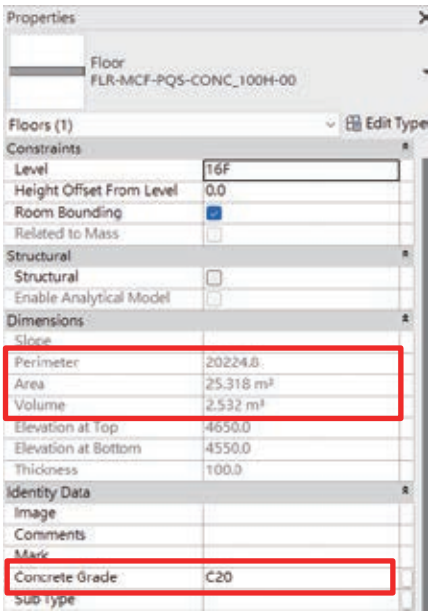
For detailed illustration, refer to Section 8.1.

6.8 MASS CONCRETE FILLING

6.8.1 BASIC MODELLING APPROACHES

Based on the floors template, create a system family type for each type and thickness of mass concrete filling, and place the individual object in the designed location to the required boundary.

The relevant information that can be extracted from the parameters includes perimeter, thickness, area, volume, etc.



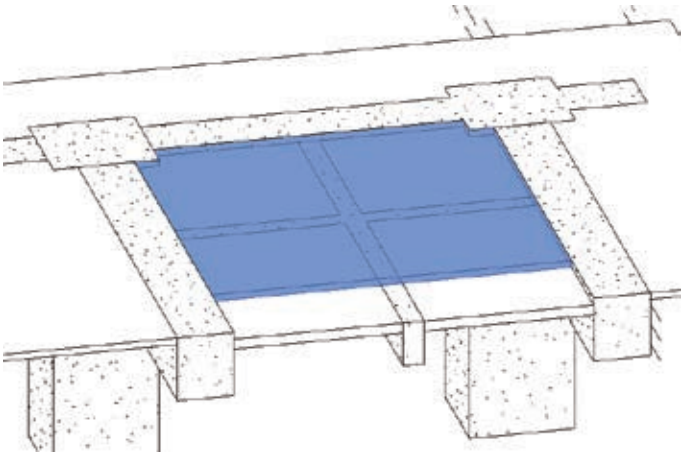


Figure 6.8.1 – 3D View of Mass Concrete Filling

6.8.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Mass concrete filling marks.
2. Mixes or strengths of concrete.

This sample model has not included:

a. Formwork.

6.8.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of mass concrete filling, create a schedule with the following fields:

<Mass Concrete Filling Schedule>

A	B	C	D	E	F	G
Family	Type	Concrete Grade	Thickness	Perimeter	Volume	Fwk_Sides of Mass conc. fill
Floor	FLR-MCF-PQS-CONC_100H-00	C20	100	20225	2.53	2.02

Set the following formulae in the schedule:

- *Fwk_Sides of Mass Conc. (area) = Thickness * Perimeter*

Note:

- Measured in m^2; formwork ≤ 300mm or > 300mm high should be stated separately according to HKSMM5.

Adjust for the following as necessary:

- Nil.

6.9 SURFACE WATER CHANNELS

6.9.1 BASIC MODELLING APPROACHES

Based on the railings template, create a system family type for each type and cross-sectional size of surface water channels by editing the rail and baluster components of the railing to become a channel, and place the individual object in the designed location to the required alignment. Pick a host for automatic alignment.

This sample model is just one of the different modelling approaches for surface water channels. The reason to create the object based on railings is that it will be easier to draw the channel alignment which can be straight or curved.

The relevant information that can be extracted from the parameters includes cross-sectional size, length, etc.

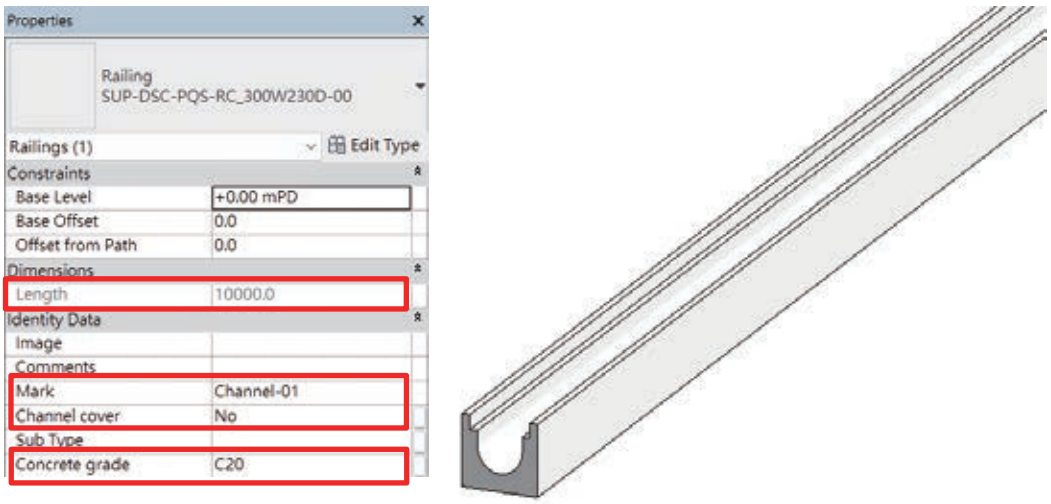

Figure 6.9.1 – 3D View of Surface Water Channel

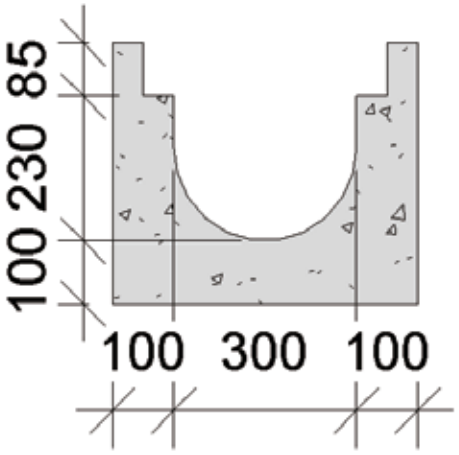

Figure 6.9.2 – Cross-Sectional Profile of Surface Water Channel

6.9.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Surface water channel marks.
2. Shapes, widths and average depths.
3. Mixes or strengths of concrete.
4. Cover details, if any.
5. Curved.

6.9.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of surface water channels, create a schedule with the following fields:

<Surface Water Channel Schedule>

A	B	C	D	E
Type	Mark	Concrete grade	Channel cover	Length
SUP-DSC-PQS-RC_300W230D-00	Channel-01	C20	No	10000
SUP-DSC-PQS-RC_300W230D-00	Channel-02	C20	No	7854
SUP-DSC-PQS-RC_300W230D-00	Channel-03	C20	No	5000
Grand total: 3				22854

Note:

- When creating the relevant schedule, while the family name “railing” is still being used, the schedule title should be revised from “Railing Schedule” to “Surface Water Channel Schedule”.

Adjust for the following as necessary:

- Nil.

6.10 NON-STRUCTURAL WALLS

6.10.1 BASIC MODELLING APPROACHES

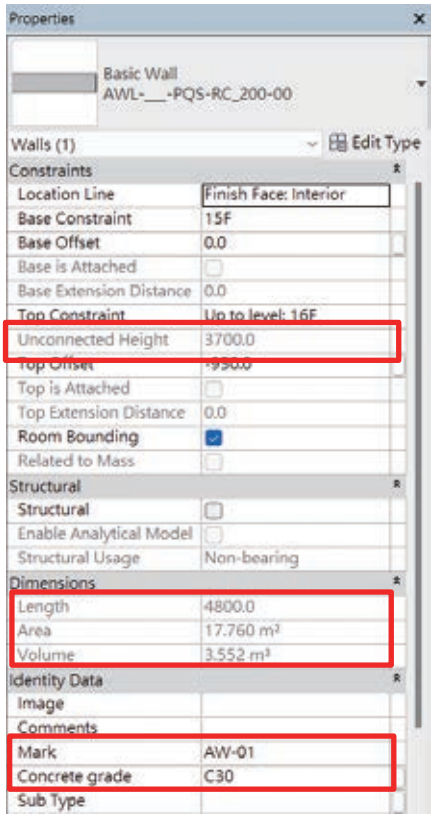
Based on the walls template, create a system family type for each type and thickness of non-structural walls, and place the individual object in the designed location to the required alignment and top and base levels.

The relevant information that can be extracted from the parameters includes length, unconnected height (height), width (thickness), area, volume, etc.

Model non-structural walls to the areas bounded by structural members.

Set the top attachment levels of the non-structural walls up to beam or slab soffits.

Set the corner wall joint method consistently as this will affect the allocation of concrete volume and formwork areas between different wall thicknesses joined together.



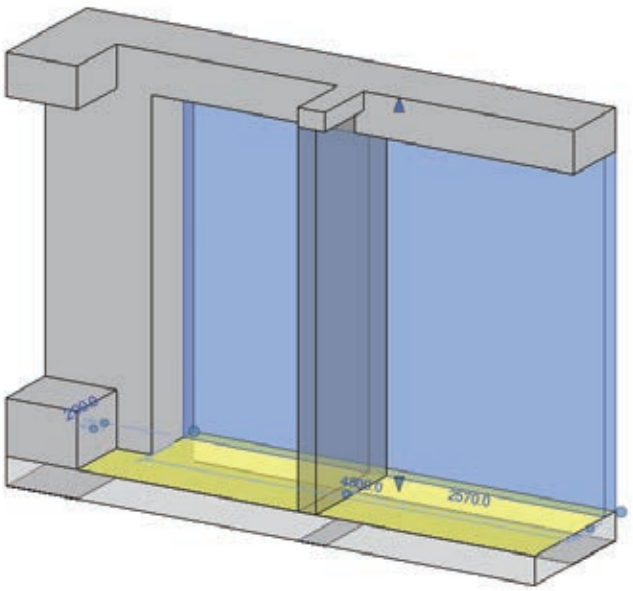


Figure 6.10.1: – 3D View of Non-structural Walls

6.10.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Wall marks.
2. Wall types – non-structural.
3. Mixes or strengths of concrete.
4. Formwork – left-in (if any).

This sample model has not included:

a. Reinforcement.

b. Formwork.

6.10.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of non-structural walls, create a schedule with the following fields:

<Wall Schedule>

A	B	C	D	E	F	G	H	I
Family	Type	Mark	Concrete grade	Width	Length	Area	Volume	Fwk_Both sides of Wall
Basic Wall	AWL-___-PQS-RC_200-00	AW-01	C30	200	4800	17.76	3.55	35.52
Basic Wall	AWL-___-PQS-RC_200-00	AW-02	C30	200	3300	12.10	2.42	24.19
Basic Wall	AWL-___-PQS-RC_200-00	AW-03	C30	200	3720	16.41	3.28	32.82
Basic Wall	AWL-___-PQS-RC_200-00	AW-04	C30	200	2600	9.25	1.85	18.50
Grand total: 4							11.10	111.03

Set the following formulae in the schedule:

- *Fwk_Both sides of Wall = Area * 2*, only for straight walls without turns since Area = external face area
- *Fwk_Both sides of Wall = Volume / Width (i.e., thickness) * 2*, more accurate based on average centre line area whether it is a straight or turned wall and whether it has varying widths or heights

Adjust for the following as necessary:

- Edges, breaks and ends of walls.

SECTION 7 – PRECAST CONCRETE

7.1 FAÇADE PANELS

7.1.1 BASIC MODELLING APPROACHES

Based on the generic model templates, create a loadable family type for each type and size of precast façade panels complete with all the components, and place the individual object in the designed location.

For modelling surface finishes, refer to Section 20.1.1 for details. For modelling built-in fixtures and fittings, refer to relevant sections for details.

The dimensions stated in the Type Name should be the overall dimensions of the object.

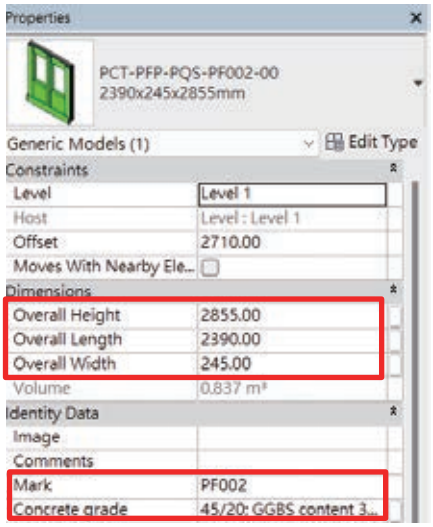

Figure 7–.1.1 – 3D Precast I Panel

7.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Facade panel marks.
2. Facade panel types.
3. Overall sizes including thicknesses. Required shapes including recesses, sleeves and boxouts.
4. Mixes or strengths of concrete.
5. Surface finishes.
6. Any built-in fixtures and fittings including doors, windows and building services, etc.
7. Any cast-in accessories.

This sample model has not included:

a. Reinforcement. Pre/post-tensioning. Lifting inserts.
b. Structural connections. Joint details.
c. Weatherproof systems and joints.
d. Requirements on moulds.
e. Building services connections.

7.1.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of precast facade panels, create a schedule with the following fields:

<Precast Facade Schedule>

A	B	C	D	E	F
Family	Type	Mark	Level	Concrete grade	Count
PCT-PFP-PQS-PF002-00	2390x245x2855mm	PF002	Level 1	45/20; GGBS content 35%	1

The precast façade panel is deemed to have included, apart from others, surface finishes and built-in fittings and fixtures.

Note:

- For measurement of built-in fixtures and fittings separately, refer to the relevant sections for details.
- For measurement of surface finishes separately, refer to Section 20.1.3 for details.

Adjust for the following as necessary:

- Nil.

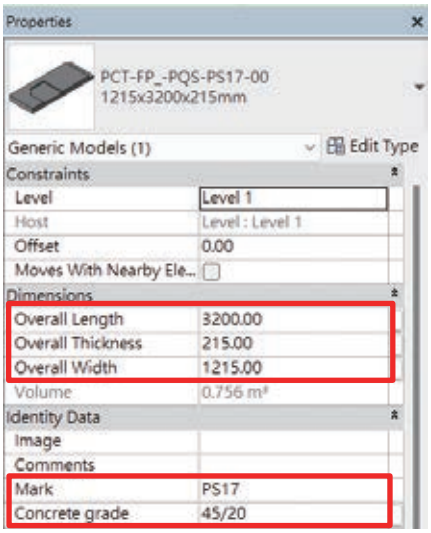
7.2 PRECAST SLABS

7.2.1 BASIC MODELLING APPROACHES

Based on the generic model templates, create a loadable family type for each type and size of precast slabs complete with all the components, and place the individual object in the designed location.

For modelling surface finishes, refer to Section 20.1.1 for details. For modelling built-in fixtures and fittings, refer to relevant sections for details.

The dimensions stated in the Type Name should be the overall dimensions of the object.



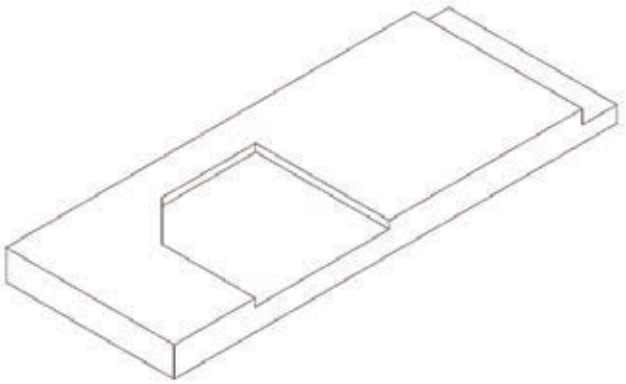


Figure 7–.2.1 – 3D View of Precast Slab

7.2.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Precast slab marks.
2. Precast slab types.
3. Overall sizes including thicknesses. Required shapes including recesses, sleeves and boxouts.
4. Mixes or strengths of concrete.
5. Surface finishes.
6. Any built-in building services, etc.
7. Any cast-in accessories.

This sample model has not included:

a. Reinforcement. Pre/post-tensioning. Lifting inserts.
b. Structural connections. Joint details.
c. Weatherproof systems and joints.
d. Requirements on moulds.
e. Building services connections.

7.2.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of precast slabs, create a schedule with the following fields:

<Precast Slab Schedule>

A	B	C	D	E
Family	Type	Mark	Concrete grade	Count
PCT-FP_-PQS-PS17-00	1215x3200x215mm	PS17	45/20	1

The precast slab is deemed to have included, apart from others, surface finishes.

Note:

- For measurement of surface finishes separately, refer to Section 20.1.3 for details.

Adjust for the following as necessary:

- Nil.

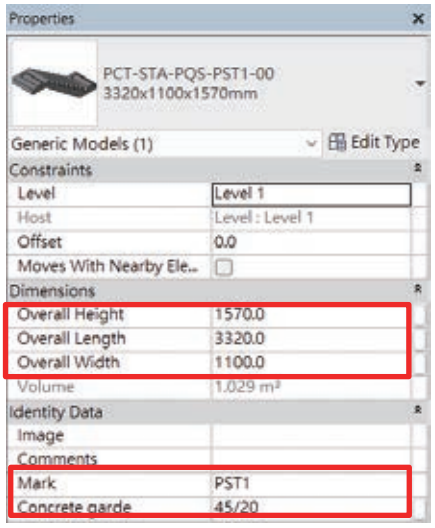
7.3 PRECAST STAIRCASES

7.3.1 BASIC MODELLING APPROACHES

Based on the generic model templates, create a loadable family type for each type and size of precast staircases complete with all the components, and place the individual object in the designed location.

For modelling surface finishes, refer to Section 20.1.1 for details. For modelling tactile, refer to Section 20.3.1 for details.

The dimensions stated in the Type Name should be the overall dimensions of the object.



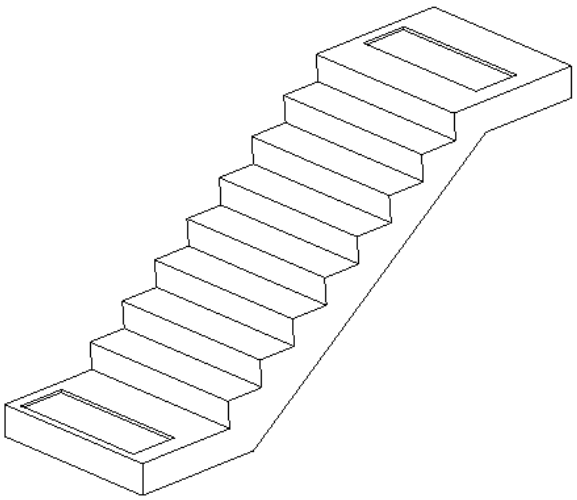


Figure 7.3.1 – 3D View of Precast Staircase

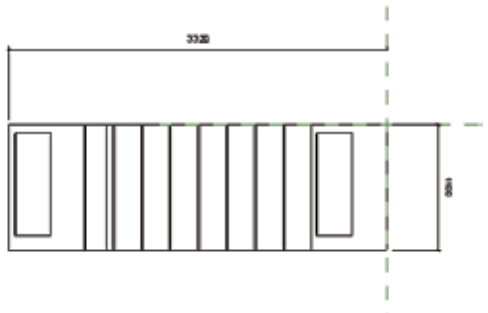

Figure 7.3.2 – Plan View of Precast Staircase

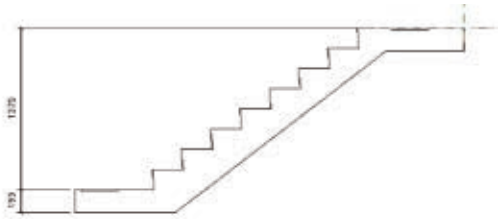

Figure 7.3.3 – Sectional View of Precast Staircase

7.3.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Precast staircase marks.
2. Precast staircase types.
3. Overall sizes including thicknesses. Required shapes including recesses, sleeves and boxouts.
4. Mixes or strengths of concrete.
5. Surface finishes.
6. Any cast-in accessories.

This sample model has not included:

a. Reinforcement. Pre/post-tensioning. Lifting inserts.
b. Structural connections. Joint details.
c. Weatherproof systems and joints.
d. Requirements on moulds.

7.3.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of precast staircases, create a schedule with the following fields:

<Precast Staircase Schedule>

A	B	C	D	E
Family	Type	Mark	Concrete garde	Count
PCT-STA-PQS-PST1-00	3320x1100x1570mm	PST1	45/20	1

The precast staircase item is deemed to include, apart from others, surface finishes and tactile.

Note:

- For measurement of surface finishes separately, refer to Section 20.1.3 for details.
- For measurement of tactile separately, refer to Section 20.3.3 for details.

Adjust for the following as necessary:

- Nil.

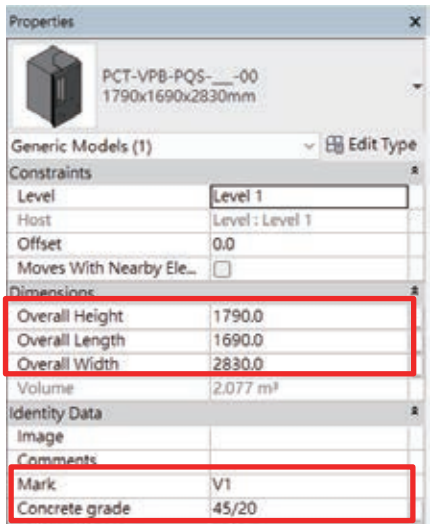
7.4 VOLUMETRIC PRECAST CONCRETE UNITS

7.4.1 BASIC MODELLING APPROACHES

Based on one of the generic model templates, create a loadable family type for each type and size of volumetric precast concrete unit complete with all the components, and place the individual object in the designed location.

For modelling surface finishes, refer to Section 20.1.1 for details. For modelling built-in fixtures and fittings, refer to relevant sections for details.

The dimensions stated in the Type Name should be the overall dimensions of the object.



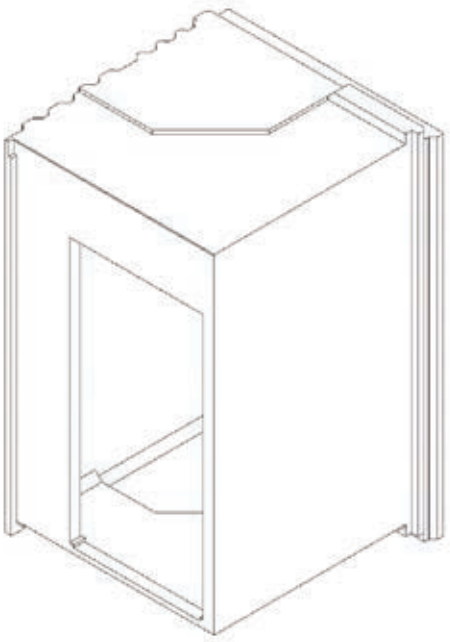


Figure 7.4.1 – 3D View of Volumetric Precast Concrete Unit

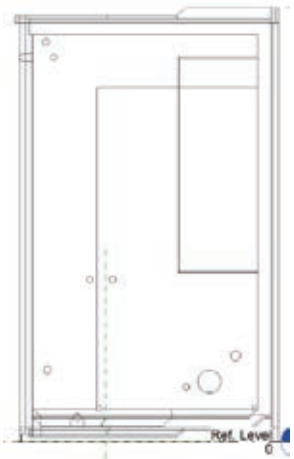

Figure 7.4.2 – Elevation View of Volumetric Precast Concrete Unit

7.4.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Volumetric precast concrete unit marks.
2. Volumetric unit types.
3. Overall sizes. Required shapes including recesses, sleeves and boxouts.
4. Mixes or strengths of concrete.
5. Surface finishes.
6. Any built-in fixtures and fittings including doors, windows, sanitary fittings and building services, etc.
7. Any cast-in accessories.

This sample model has not included:

a. Reinforcement. Pre/post-tensioning. Lifting inserts.
b. Structural connection. Joint details.
c. Weatherproof systems and joints.
d. Requirements on moulds.
e. Building services connections.

7.4.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of volumetric precast concrete units, create a schedule with the following fields:

<Volumetric precast concrete units Schedule>

A	B	C	D	E
Family	Type (Overall size)	Mark	Concrete grade	Count
PCT-VPB-PQS-___-00	1790x1690x2830mm	V1	45/20	1

The volumetric precast concrete unit is deemed to include, apart from others, surface finishes and built-in fixtures and fittings.

Note:

- For measurement of built-in fixtures and fittings separately, refer to the relevant sections for details.
- For measurement of surface finishes separately, refer to Section 20.1.3 for details.

Adjust for the following as necessary:

- Nil.

SECTION 8 – MASONRY

8.1 BRICKWORK AND BLOCKWORK

8.1.1 BASIC MODELLING APPROACHES

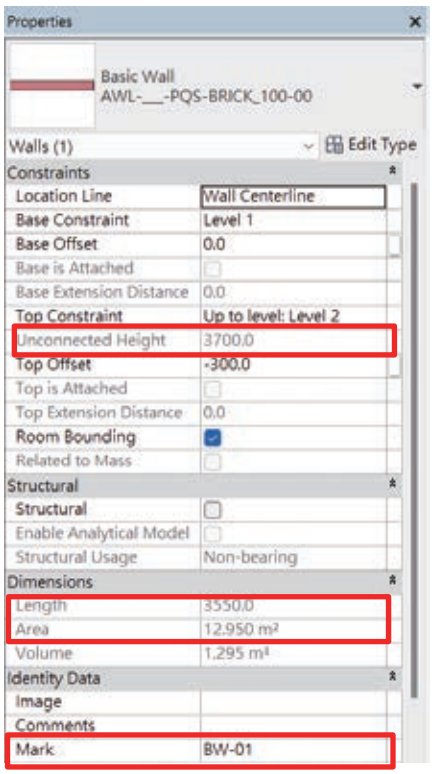
Based on the walls template, create a system family type for each type and thickness of brick walls / block walls / panel walls, and place the individual object in the designed location to the required alignment and top and base levels.

The relevant information that can be extracted from the parameters includes wall type, length, unconnected height (height), width (thickness), area, etc.

The top of the brick wall / block wall / panel wall is below the horizontal elements (e.g., beam, slab, etc.).

Set the top attachment levels or switch the join-order with beams and slabs such that the wall brick or block area is up to beam or slab soffits only.

Set the corner wall joint method consistently as this will affect the allocation of brick or block areas between different wall thicknesses joined together.



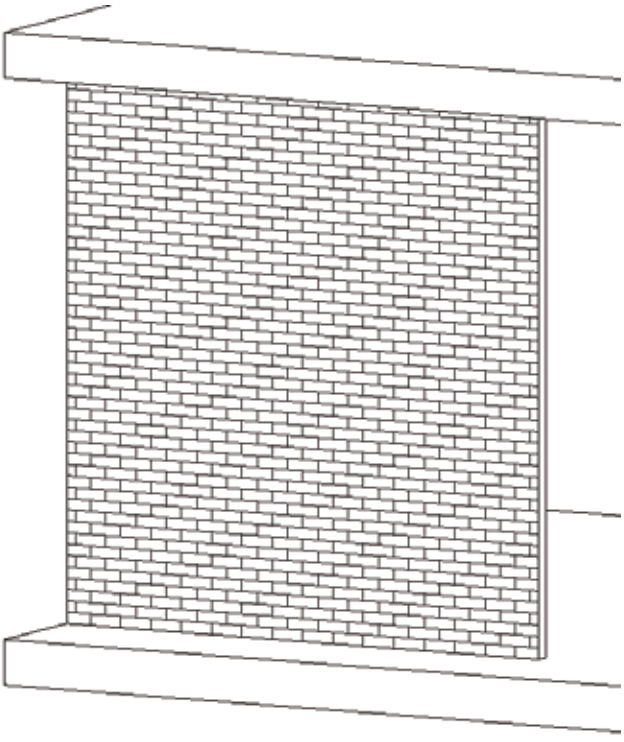


Figure 8.1.1 – 3D View of Brick / Block Wall

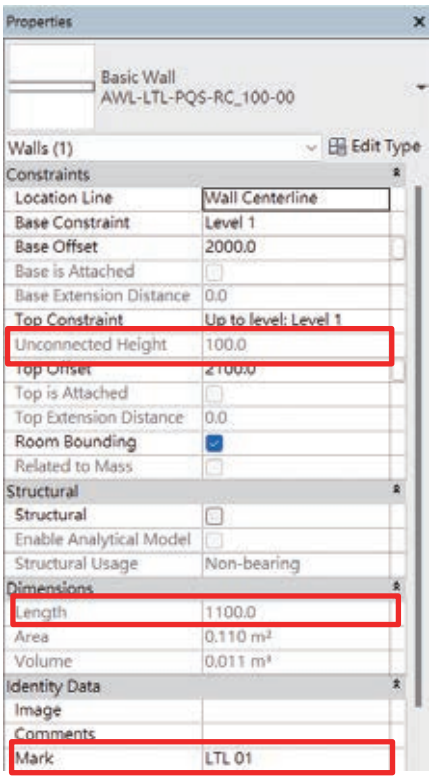
Lintel, if created on top of the door opening, would be overlapped with the brick/block walls. If lintel is modelled, information on the details for respective openings or locations shall be provided.



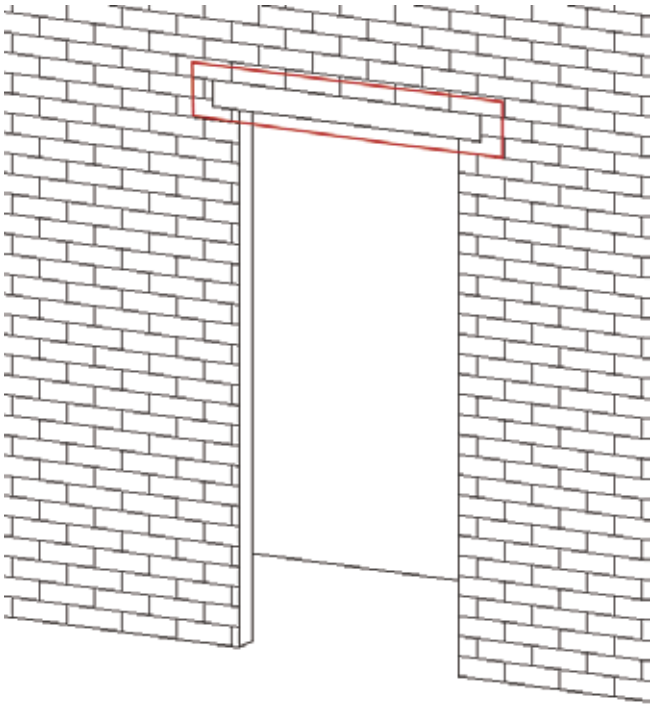


Figure 8.1.2 – Lintel on Top of Door Opening

8.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

- Wall marks.
- Wall types.
- Materials, qualities, construction and laying methods.
- Wall thicknesses.
- FRP and insulation properties.
- Damp-proof courses (if any).
- Reinforcement (if any).
- Stiffeners for walls exceeding a specified height (if any).
- Lintels, with cross-sectional sizes, lengths of end laps, concrete mixes and reinforcement details (if any).

8.1.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of masonry, create a schedule with the following fields:

<Blockwall Schedule>

A	B	C	D	E	F
Family	Type	Mark	Length	Unconnected Height	Area
Basic Wall	AWL-___-PQS-BRICK_100-00	BW-01	3550	3700	12.95
Basic Wall	AWL-___-PQS-BRICK_100-00	BW-02	6200	3700	20.96
Grand total: 2					33.91

For measurement of lintels, create a schedule with the following fields:

<Lintel Schedule>

A	B	C	D	E	F
Family	Type	Mark	Length	Unconnected Height	Count
Basic Wall	AWL-LTL-PQS-RC_100-00	LTL 01	1100	100	1

Adjust for the following as necessary:

- Nil.

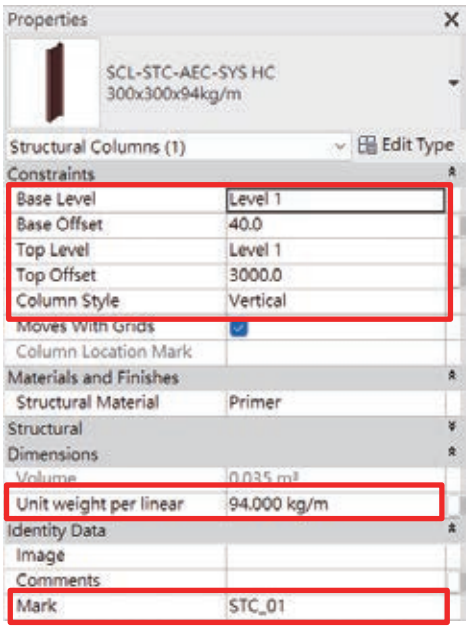
SECTION 9 – STRUCTURAL STEELWORK

9.1 STEEL COLUMNS

9.1.1 BASIC MODELLING APPROACHES

Based on the structural columns template, create a loadable family type for each type and cross-sectional size of steel columns, and place the individual object in the designed location to the required top and base levels.

The relevant information that can be extracted from the parameters includes cross-sectional size, length, unit weight per linear length, volume, etc.



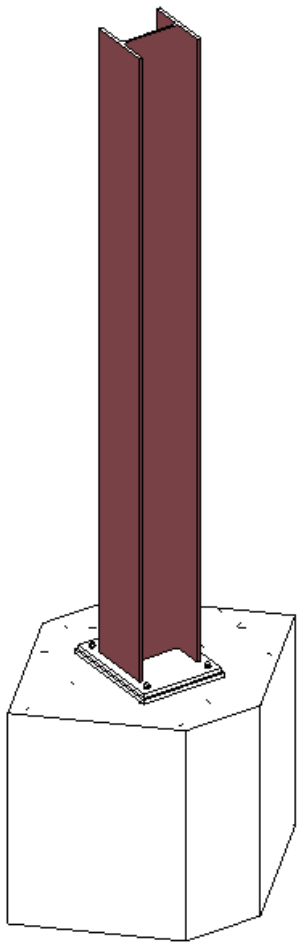


Figure 9.1.1 – 3D View of Steel Column

9.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Steel column marks.
2. Cross-sectional sizes and unit weights per length.
3. Types and grades of materials.
4. Surface treatments and finishes.
5. Castellated/tapered/curved/cambered.

9.1.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of steel columns, create a schedule with the following fields:

<Structural Column Schedule>

A	B	C	D	E	F
Family	Type	Mark	Length	Unit weight per linear	Weight
SCL-STC-AEC-SYS HC	300x300x94kg/m	STC_01	2960	94.00 kg/m	278.24 kg
SCL-STC-AEC-SYS HC	300x300x94kg/m	STC_02	2960	94.00 kg/m	278.24 kg
SCL-STC-AEC-SYS HC	300x300x94kg/m	STC_03	2960	94.00 kg/m	278.24 kg
SCL-STC-AEC-SYS HC	300x300x94kg/m	STC_04	2960	94.00 kg/m	278.24 kg
Grand total: 4			11840		1112.96 kg

Set the following formula in the schedule:

- *Weight = Length * Unit weight per linear (length)*

For measurement of painting, create a material take-off schedule with the following fields:

<Structural Column Material Takeoff>

A	B	C	D	E	F
Family	Type	Mark	Length	Material Name	Material: Area
SCL-STC-AEC-SYS HC	300x300x94kg/m	STC_01	2960	Primer	5.20
SCL-STC-AEC-SYS HC	300x300x94kg/m	STC_02	2960	Primer	5.20
SCL-STC-AEC-SYS HC	300x300x94kg/m	STC_03	2960	Primer	5.20
SCL-STC-AEC-SYS HC	300x300x94kg/m	STC_04	2960	Primer	5.20
Grand total: 4					20.81

Or base on a specially defined surface area parameter for the structural steel objects.

Note:

- According to HKSMM5, the mass of structural members is measured based on their overall lengths with no deduction for splay cuts or mitred ends, notches and holes, and no addition for mass of weld fillets, bolts, nuts, washers, rivets, rolling margins, galvanising or other protective coatings.

Adjust for the following as necessary:

- Nil.

9.2 STEEL BEAMS

9.2.1 BASIC MODELLING APPROACHES

Based on the structural framing template, create a loadable family type for each type and cross-sectional size of steel beams, and place the individual object in the designed location to the required alignment and length.

The relevant information that can be extracted from the parameters includes cross-sectional size, cut length (beam length), unit weight per linear length, volume, etc.

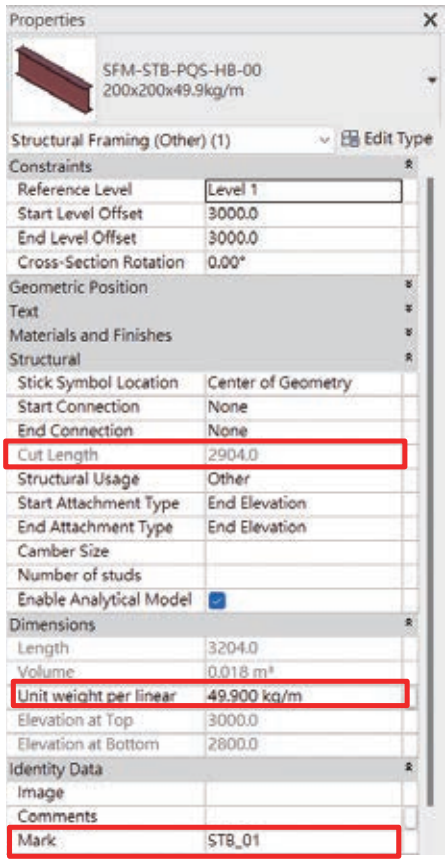

Figure 9.2.1 – 3D View of Steel Beam

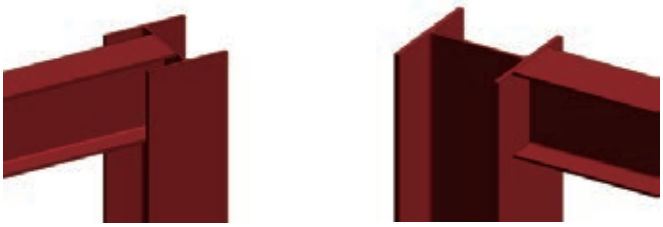

Figure 9.2.2 – Connection details of Steel Beam

9.2.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Steel beam marks.
2. Cross-sectional sizes and unit weights per length.
3. Types and grades of materials.
4. Surface treatments and finishes.
5. Castellated/tapered/curved/cambered.

9.2.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of steel beams, create a schedule with the following fields:

<Structural Framing Schedule>

A	B	C	D	E	F
Family	Type	Mark	Cut Length	Unit weight per linear	Weight
SFM-STB-PQS-HB-00	200x200x49.9kg/m	STB_01	2904	49.90 kg/m	144.91 kg
SFM-STB-PQS-HB-00	200x200x49.9kg/m	STB_02	2904	49.90 kg/m	144.91 kg
SFM-STB-PQS-HB-00	200x200x49.9kg/m	STB_04	3000	49.90 kg/m	149.70 kg
SFM-STB-PQS-HB-00	200x200x49.9kg/m	STB_03	3000	49.90 kg/m	149.70 kg
Grand total: 4			11808		589.22 kg

Set the following formula in the schedule:

- *Weight = Cut Length * Unit weight per linear (length)*

For measurement of painting, create a material take-off schedule with the following fields:

<Structural Framing Material Takeoff>

A	B	C	D	E	F
Family	Type	Mark	Cut Length	Material Name	Material: Area
SFM-STB-PQS-HB-00	200x200x49.9kg/m	STB_01	2904	Primer	3.37
SFM-STB-PQS-HB-00	200x200x49.9kg/m	STB_02	2904	Primer	3.37
SFM-STB-PQS-HB-00	200x200x49.9kg/m	STB_04	3000	Primer	3.49
SFM-STB-PQS-HB-00	200x200x49.9kg/m	STB_03	3000	Primer	3.49
Grand total: 4					13.72

Or base on a specially defined surface area parameter for the structural steel objects.

Note:

- According to HKSMM5, the mass of structural members is measured based on their overall lengths with no deduction for splay cuts or mitred ends, notches and holes, and no addition for mass of weld fillets, bolts, nuts, washers, rivets, rolling margins, galvanising or other protective coatings.

Adjust for the following as necessary:

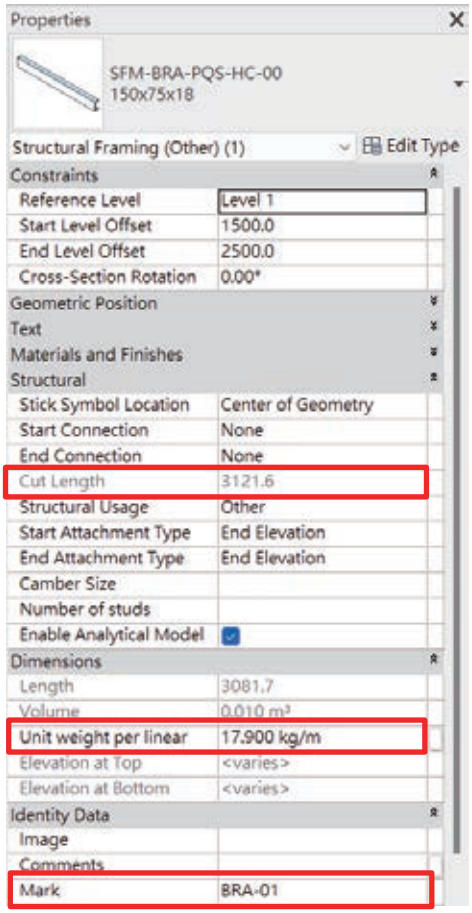
- Nil.

9.3 STEEL BRACINGS

9.3.1 BASIC MODELLING APPROACHES

Based on the structural framing template, create a loadable family type for each type and cross-sectional size of steel bracings, and place the individual object in the designed location to the required alignment and length.

The relevant information that can be extracted from the parameters includes cross-sectional size, cut length (beam length), unit weight per linear length, volume, etc.



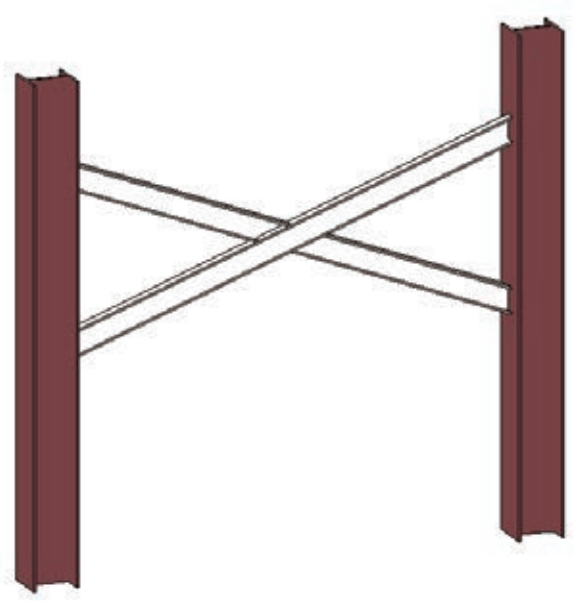


Figure 9.3.1 – 3D View of Steel Bracing

9.3.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Steel bracing marks.
2. Types and grades of materials.
3. Surface treatments and finishes.
4. Cross-sectional sizes and unit weights per length.
5. Castellated/tapered/curved/cambered.

9.3.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of steel bracings, create a schedule with the following fields:

<Structural Bracing Schedule>

A	B	C	D	E	F
Family	Type	Mark	Cut Length	Unit weight per linear	Weight
SFM-BRA-PQS-HC-00	150x75x18	BRA-02	1530	17.90 kg/m	27.38 kg
SFM-BRA-PQS-HC-00	150x75x18	BRA-01	3122	17.90 kg/m	55.88 kg
SFM-BRA-PQS-HC-00	150x75x18	BRA-03	1540	17.90 kg/m	27.57 kg
Grand total: 3			6192		110.83 kg

Set the following formula in the schedule:

- *Weight = Cut Length * Unit weight per linear (length)*

For measurement of painting, see example for steel beams.

Note:

- According to HKSMM5, the mass of structural members is measured based on their overall lengths with no deduction for splay cuts or mitred ends, notches and holes, and no addition for mass of weld fillets, bolts, nuts, washers, rivets, rolling margins, galvanising or other protective coatings.

Adjust for the following as necessary:

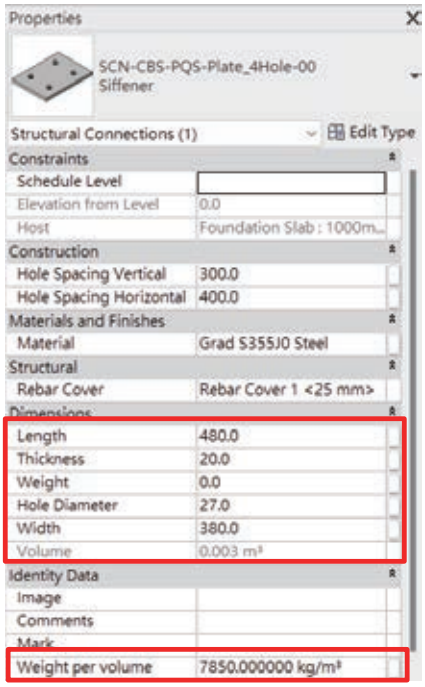
- Nil.

9.4 CONNECTIONS TO FRAMED MEMBERS

9.4.1 BASIC MODELLING APPROACHES

Based on the structural connections template, create a loadable family type for each type and size of connection plates by sketching the profile of the steel plates/stiffeners or brackets etc., and place the individual object in the designed location.

The relevant information that can be extracted from the parameters includes connection type, length, width, thickness, volume, unit weight per volume, etc.



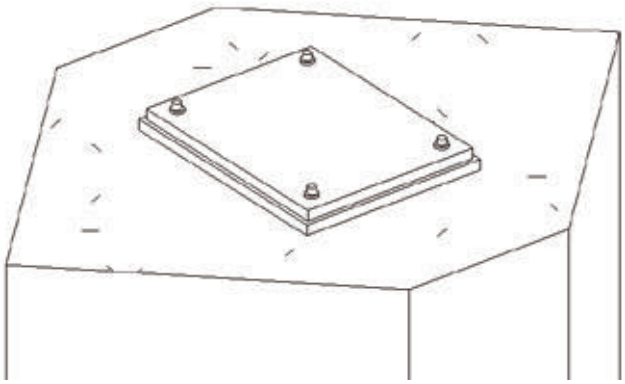


Figure 9.4.1 – 3D View of Connection Detail

9.4.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Connection marks.
2. Connection types.
3. Types and grades of materials.
4. Surface treatments and finishes.

9.4.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of connections to framed members, create a schedule with the following fields:

<Structural Connection Schedule>

A	B	C	D	E	F	G	H
Family	Type	Length	Width	Thinckness	Volume	Weight per volume	Weight
SCN-CBS-PQS-Plate_4Hole-00	Siffener	480	380	20	0.003 m^3	7850.00 kg/m^3	25.81 kg
SCN-CBS-PQS-Plate_4Hole-00	plate	500	400	20	0.004 m^3	7850.00 kg/m^3	31.04 kg
SCN-CBS-PQS-Plate_4Hole-00	Siffener	480	380	20	0.003 m^3	7850.00 kg/m^3	25.81 kg
SCN-CBS-PQS-Plate_4Hole-00	plate	500	400	20	0.004 m^3	7850.00 kg/m^3	31.04 kg
SCN-CBS-PQS-Plate_4Hole-00	Siffener	480	380	20	0.003 m^3	7850.00 kg/m^3	25.81 kg
SCN-CBS-PQS-Plate_4Hole-00	plate	500	400	20	0.004 m^3	7850.00 kg/m^3	31.04 kg
SCN-CBS-PQS-Plate_4Hole-00	Siffener	480	380	20	0.003 m^3	7850.00 kg/m^3	25.81 kg
SCN-CBS-PQS-Plate_4Hole-00	plate	500	400	20	0.004 m^3	7850.00 kg/m^3	31.04 kg
Grand total: 8					0.029 m^3		227.41 kg

Set the following formula in the schedule:

- *Weight = Volume * Weight per volume*

Note:

- According to HKSMM5, the mass of structural members is measured based on their overall lengths with no deduction for splay cuts or mitred ends, notches and holes, and no addition for mass of weld fillets, bolts, nuts, washers, rivets, rolling margins, galvanising or other protective coatings.

Adjust for the following as necessary:

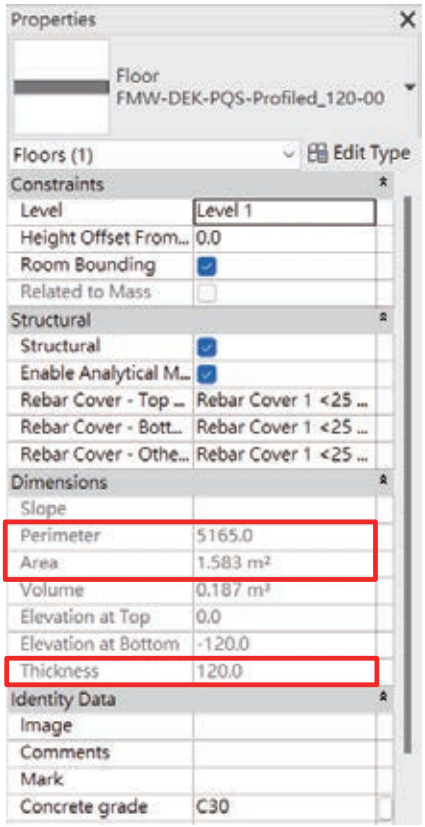
- Nil.

9.5 METAL PROFILED SHEET DECKING

9.5.1 BASIC MODELLING APPROACHES

Based on the structural floors template, create a system family type for each type and thickness of metal profiled sheet decking, and place the individual object in the designed location to the required boundary.

The relevant information that can be extracted from the parameters includes thickness, perimeter, area, etc.



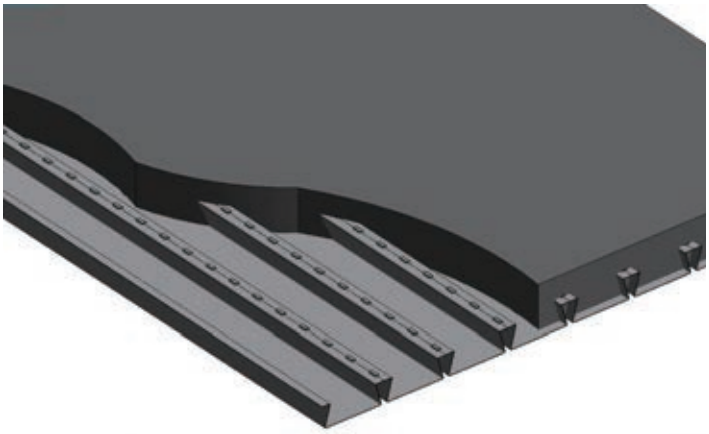


Figure 9.5.1 – 3D View of Metal Profiled Sheet Decking

9.5.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Steel decking marks. (if any)
2. Materials, qualities, construction, surface finishes and fixing methods.
3. Profiles and thicknesses of decking.
4. Horizontal/sloping/curved.

9.5.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of metal profiled sheet decking, create a schedule with the following fields:

<Metal Profiled Sheet Decking Schedule>

A	B	C	D
Family	Type	Thickness	Area
Floor	FMW-DEK-PQS-Profiled_120-00	120	1.58

Note:

- Add a field to enter the soffit heights from finished floor level below ≤ 5.00 m, and thereafter in 1.50 m stages, according to HKSMM5.
- According to HKSMM5, metal decking area is measured based on the finished area of concrete cast onto the decking.
- There is an alternative measurement rule of no deduction for voids ≤ 1.00 m^2.

Adjust for the following as necessary:

- Nil.

SECTION 10 – WATERPROOFING

10.1 WATERPROOFING

10.1.1 BASIC MODELLING APPROACHES

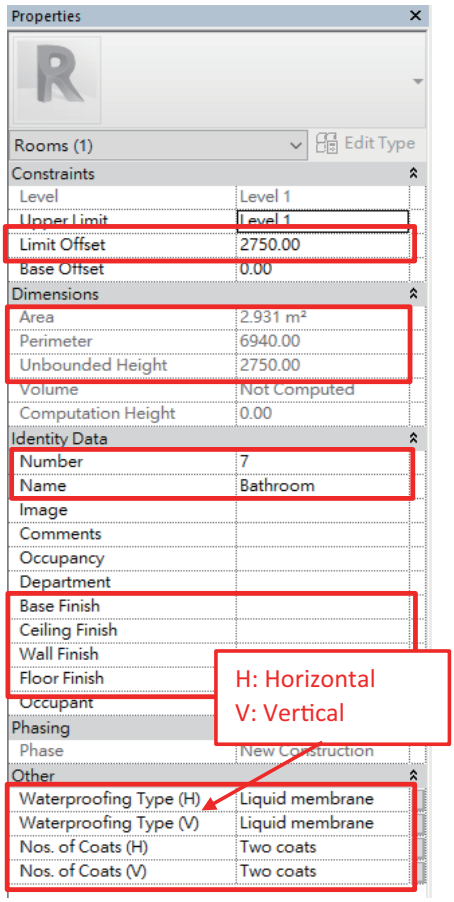
Waterproofing includes roofing, tanking and damp-proofing, and related work. There can be three modelling approaches for waterproofing as follows:

1) Create Rooms;
2) Apply Paint; or
3) Create separate layers by modelling Floor and Wall as waterproofing layers.

Refer to Section 20.1.1 for details of the modelling approaches.

1) Create Rooms:

Example of waterproofing modelled by Rooms:



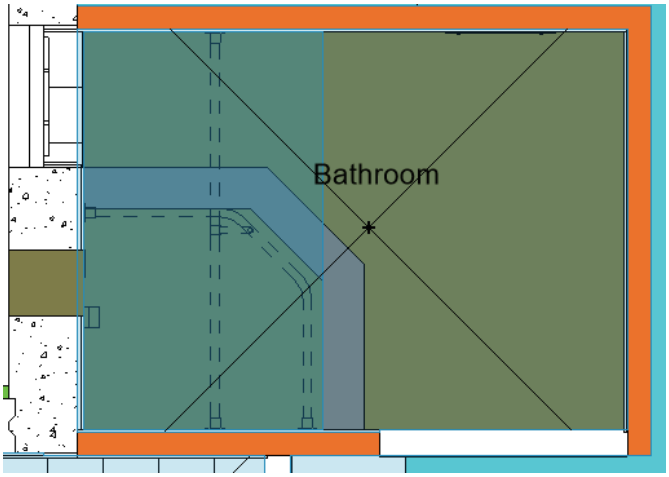


Figure 10.1.1 – Plan View of Bathroom with Rooms

2) Apply Paint:

Example of waterproofing by applying “Paint”:

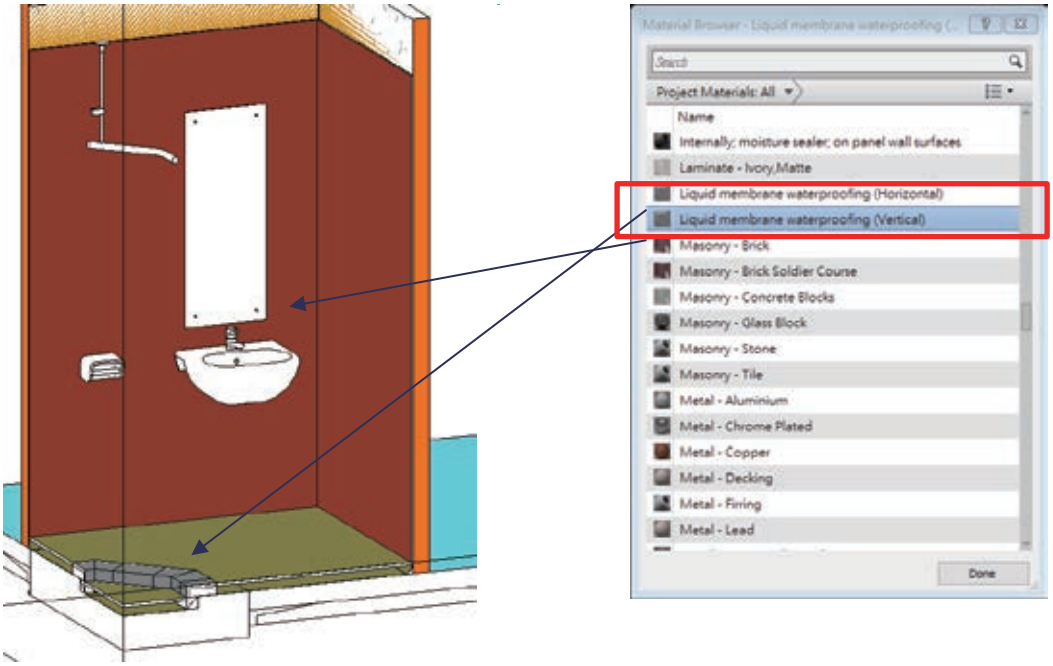

Figure 10.1.2 – 3D View of Area Applying “Paint” for Waterproofing Layer

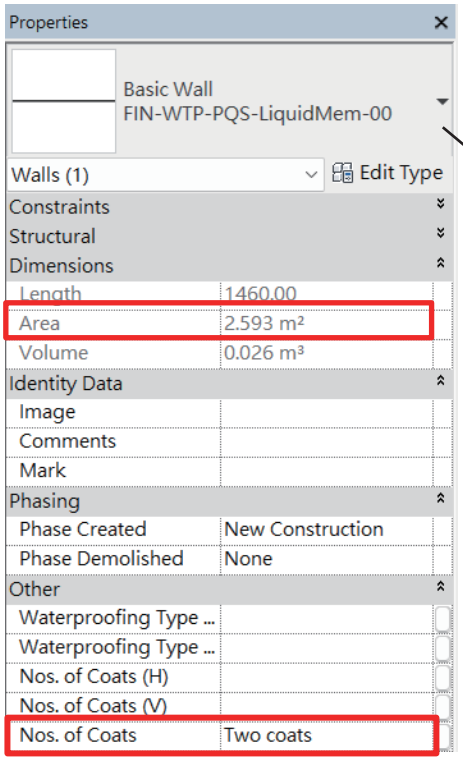
3) Create separate layers by modelling Floor and Wall as waterproofing layers:

Example of waterproofing modelled by separate layers of walls and floors:



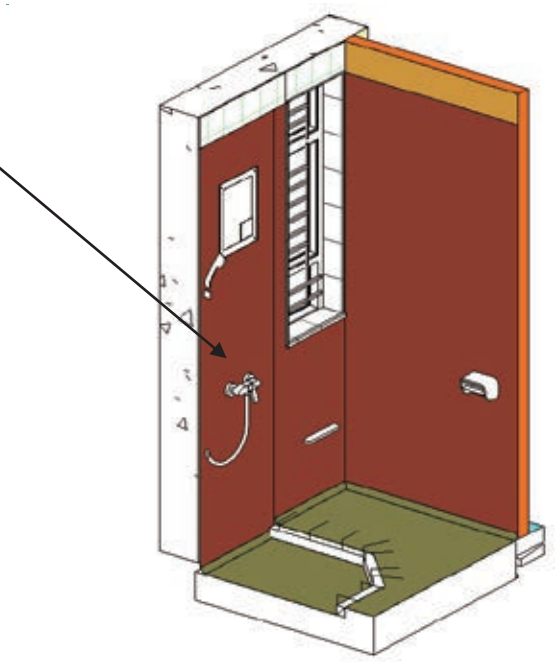


Figure 10.1.3 – 3D View of Waterproofing on Walls

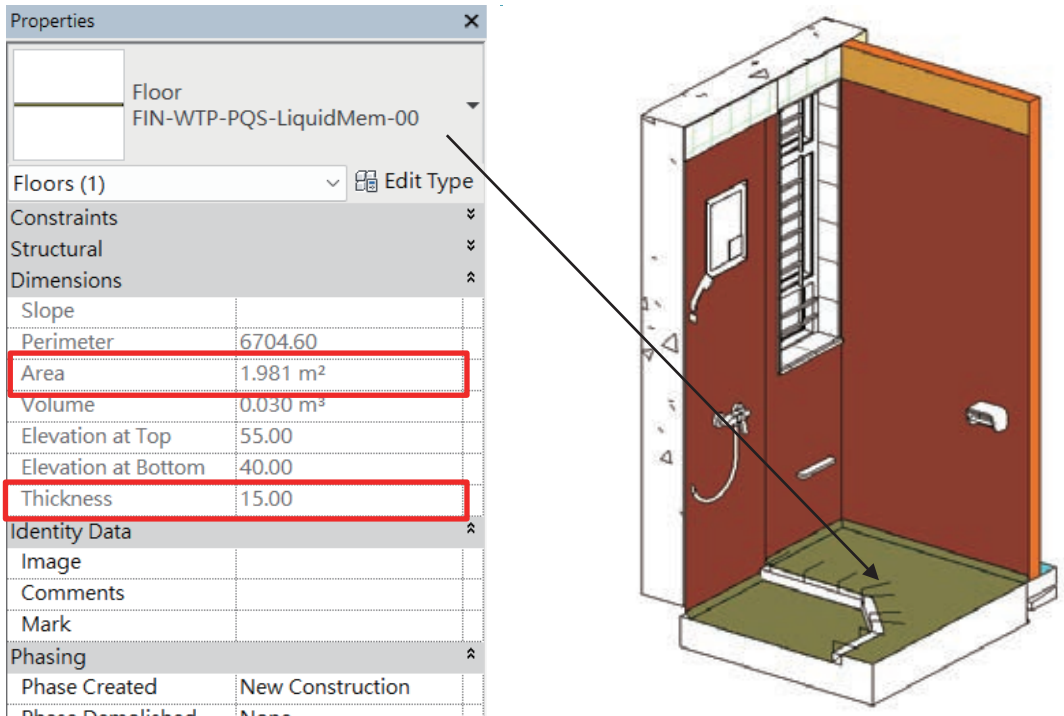

Figure 10.1.4 – 3D View of Waterproofing on Floors

10.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Waterproofing marks. (if any)
2. Waterproofing types.
3. Kind and quality of waterproofing materials.
4. Thicknesses and number of coats or layers.
5. Horizontal/sloping (> 15° from horizontal)/vertical/curved.

Depending on the modelling approach, the model may not have included all the information as listed above.

10.1.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of waterproofing, create relevant material take-off schedules or schedules depending on the modelling approach.

1) Create Rooms:

For measurement of waterproofing by Rooms, create a schedule with the following fields (details referring to Section 20.1.3):

<Waterproofing Schedule - Horizontal by Rooms>

A	B	C	D	E
Name	Waterproofing Type (H)	No. of Coats (H)	Area	Count
Bathroom	Liquid membrane	Two coats	2.93	1

Example of Waterproofing Schedule – Horizontal by Rooms

<Waterproofing Schedule - Vertical by Rooms>

A	B	C	D	E	F	G
Name	Waterproofing Type (V)	No. of Coats (V)	Perimeter	Height	Wall Area (Perimeter x Height)	Count
Bathroom	Liquid membrane	Two coats	6940.00	2330.00	16.17	1

Example of Waterproofing Schedule – Vertical by Rooms

2) Apply Paint:

For measurement of waterproofing by applying "Paint" with split function, create a material take-off schedule to include "Material: Area" (details referring to Section 20.1.3):

<Waterproofing Schedule by Paint>

A	B	C	D
Material: Name	Waterproofing Type	No. of Coats	Material: Area
Liquid membrane waterproofing (Horizontal)	Liquid membrane	Two coats	1.98
Liquid membrane waterproofing (Horizontal)	Liquid membrane	Two coats	0.68
Liquid membrane waterproofing (Horizontal): 2			2.66
Liquid membrane waterproofing (Vertical)	Liquid membrane	Two coats	3.32
Liquid membrane waterproofing (Vertical)	Liquid membrane	Two coats	2.71
Liquid membrane waterproofing (Vertical)	Liquid membrane	Two coats	2.59
Liquid membrane waterproofing (Vertical)	Liquid membrane	Two coats	4.55
Liquid membrane waterproofing (Vertical): 4			13.18

Example of Waterproofing – Schedule by Applying Paint

3) Create separate layers by modelling Floor and Wall as waterproofing layers:

For measurement of waterproofing layers modelled by Floor and Wall, create material take-off schedules to include the following fields (details referring to Section 20.1.3):

<Waterproofing - Horizontal Schedule>

A	B	C	D	E	F
Family	Type	No. of Coats	Material: Name	Material: Area	Sloping
Floor	FIN-WTP-PQS-LiquidMem-00	Two coats	Liquid membrane waterproofing (Horizontal)	1.98	☐
Floor	FIN-WTP-PQS-LiquidMem-00	Two coats	Liquid membrane waterproofing (Horizontal)	0.68	☐
Grand total: 2				2.66	

Example of Waterproofing – Horizontal Schedule (created by "Floor")

<Waterproofing - Vertical Schedule>

A	B	C	D	E
Family	Type	No. of Coats	Material: Name	Material: Area
Basic Wall	FIN-WTP-PQS-LiquidMem-00	Two coats	Liquid membrane waterproofing (Vertical)	3.32
Basic Wall	FIN-WTP-PQS-LiquidMem-00	Two coats	Liquid membrane waterproofing (Vertical)	2.71
Basic Wall	FIN-WTP-PQS-LiquidMem-00	Two coats	Liquid membrane waterproofing (Vertical)	2.59
Basic Wall	FIN-WTP-PQS-LiquidMem-00	Two coats	Liquid membrane waterproofing (Vertical)	4.55
Grand total: 4				13.18

Example of Waterproofing – Vertical Schedule (created by "Wall")

Note:

- According to HKSMM5, waterproofing area is measured based on that in contact with base.

Adjust for the following as necessary:

- Doors and windows (for the approach adopting "Rooms", the quantities given are based on the overall dimensions without deduction of openings).
- Voids and openings if required.
- Skirtings and turn-ups, curbs, channels, cesspools, sumps, etc.
- As required based on the SMM rule chosen.

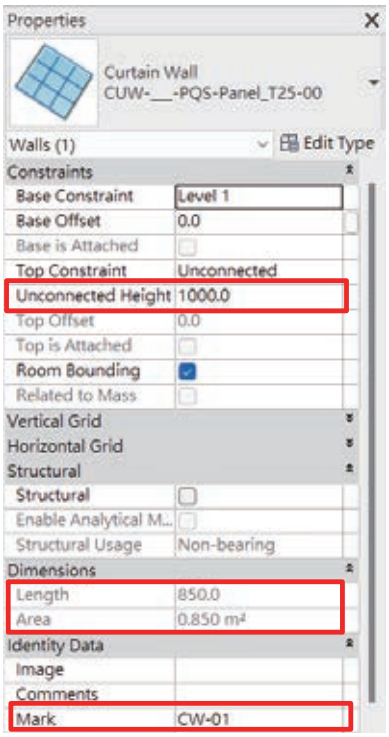
SECTION 11 – CURTAIN AND GLASS WALLING, CLADDING AND COVERINGS

11.1 CURTAIN WALLING

11.1.1 BASIC MODELLING APPROACHES

Based on the walls template, create a system family type for each type of curtain walls, and place the individual object in the designed location to the required alignment and top and base levels.

The relevant information that can be extracted from the parameters includes length, unconnected height (height), area, etc.



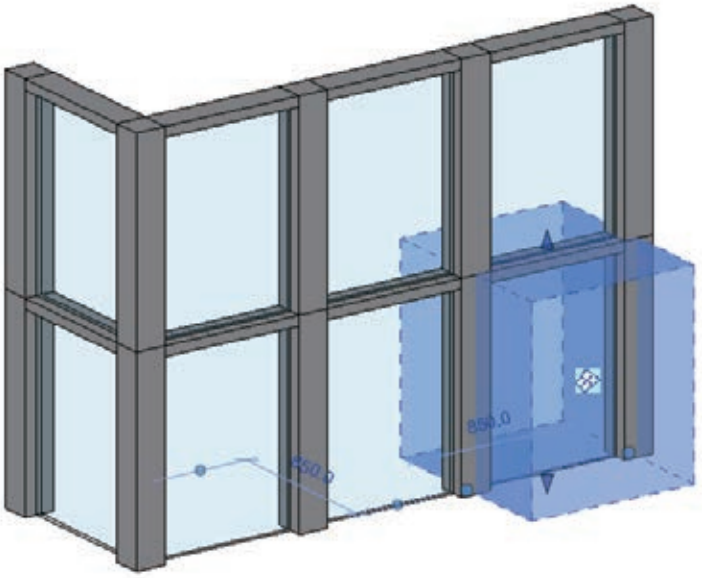


Figure 11.1.1 – 3D View of Curtain Walling

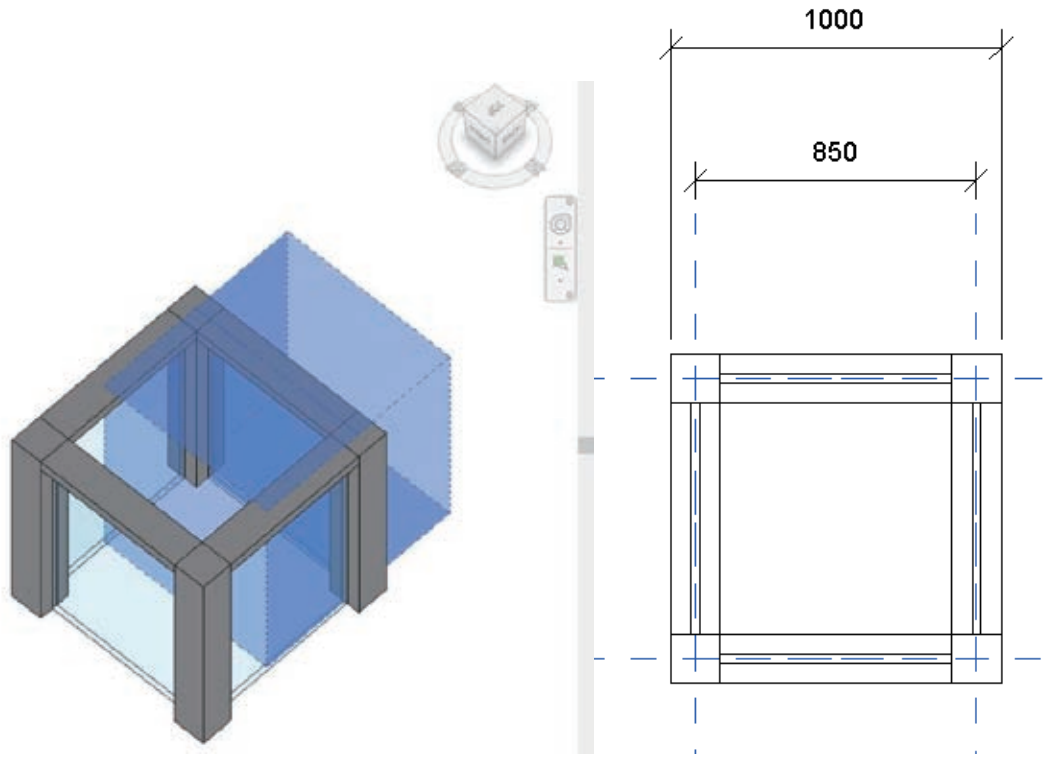
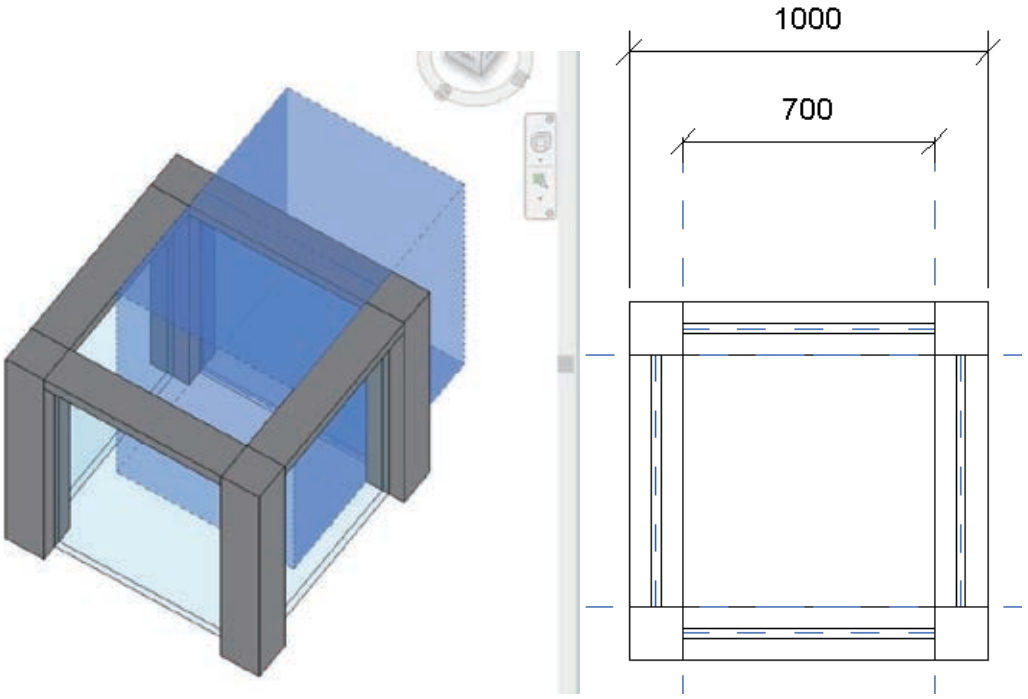
Length is determined by the profile setting.

Example 1 shows the profile cut at centre of mullion:



Example 2 shows the profile at internal side of mullion:



11.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Curtain wall marks.
2. Materials, qualities, construction, and surface finishes of framing members.
3. Types and thicknesses of vision and spandrel glass panels.
4. Mullion and transom spacings.
5. Vertical/horizontal/sloping (> 15° from horizontal)/curved.
6. Opening types – openable windows/glazed doors/louvres/protective bearers/others.

11.1.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of curtain walls, create a schedule with the following fields:

<Curtain Wall Schedule>

A	B	C	D	E	F
Family	Type	Mark	Length	Unconnected Height	Area
Curtain Wall	CUW-___-PQS-Panel_T25-00	CW-01	850	1000	0.85
Curtain Wall	CUW-___-PQS-Panel_T25-00	CW-02	850	1000	0.85
Curtain Wall	CUW-___-PQS-Panel_T25-00	CW-03	850	1000	0.85
Curtain Wall	CUW-___-PQS-Panel_T25-00	CW-04	850	1000	0.85
Curtain Wall	CUW-___-PQS-Panel_T25-00	CW-05	850	1000	0.85
Curtain Wall	CUW-___-PQS-Panel_T25-00	CW-06	850	1000	0.85
Curtain Wall	CUW-___-PQS-Panel_T25-00	CW-07	850	1000	0.85
Curtain Wall	CUW-___-PQS-Panel_T25-00	CW-08	850	1000	0.85
Grand total: 8					6.80

Note:

- According to HKSMM5, curtain walling area is measured based on its exposed faces.

Adjust for the following as necessary:

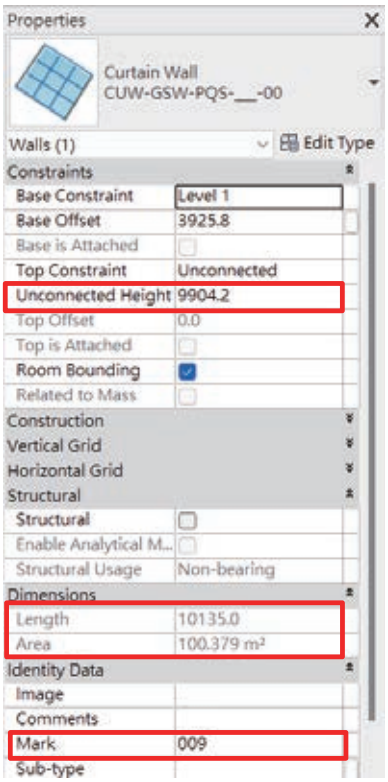
- Length, depending on whether the profile setting matches the method of measurement.

11.2 GLASS WALLING

11.2.1 BASIC MODELLING APPROACHES

Based on the walls template, create a system family for each type of glass walls, and place the individual object in the designed location to the required alignment and top and base levels.

The relevant information that can be extracted from the parameters includes length, unconnected height (height), area, etc.



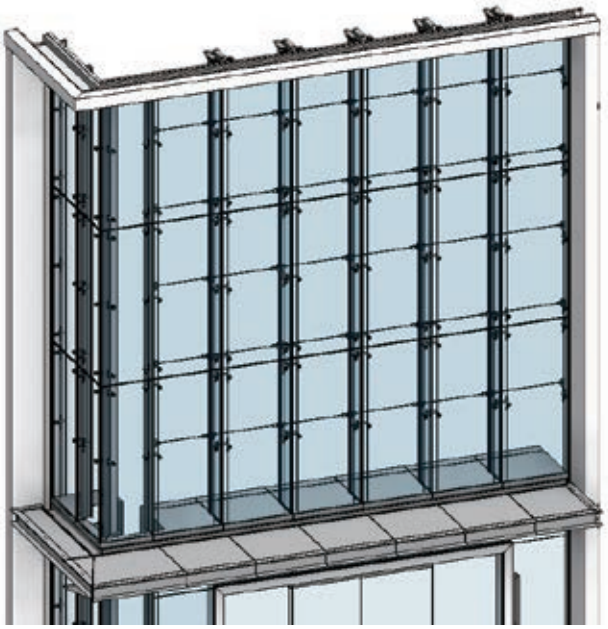


Figure 11.2.1 3D View of Glass Walling

11.2.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1 Glass wall marks.
2 Materials, qualities, construction and surface finishes of framing members.
3 Types and thicknesses of glass panels.
4 Mullion spacings. Typical heights of glass panels.
5 Vertical/horizontal/sloping (> 15° from horizontal)/curved.
6 Opening types – openable windows/glazed doors/louvres/protective bearers/others.

11.2.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of glass walls, create a schedule with the following fields:

<Glass Wall Schedule>

A	B	C	D	E	F
Family	Type	Mark	Length	Unconnected Height	Area
Curtain Wall	CUW-GSW-PQS-___-00	009	10135	9904	100.38
Curtain Wall	CUW-GSW-PQS-___-00	010	2623	9904	25.98
Grand total: 2					126.36

Note:

- When creating the relevant schedule, while the family name “curtain wall” is still being used, the schedule title should be revised from “Curtain Wall Schedule” to “Glass Wall Schedule”.
- According to HKSMM5, glass walling area is measured based on its exposed faces.

Adjust for the following as necessary:

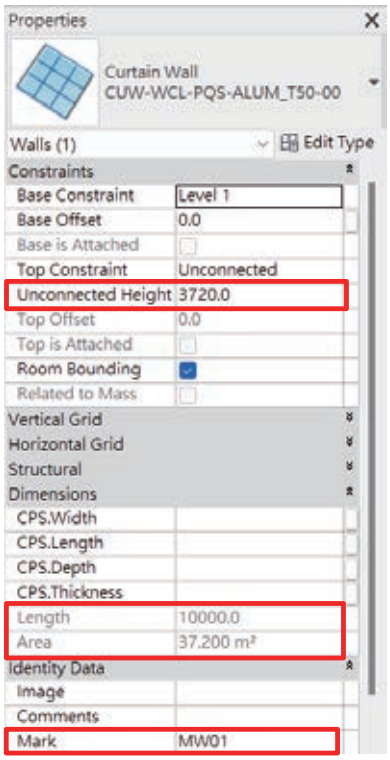
- Length, depending on whether the profile setting matches the method of measurement.

11.3 WALL CLADDING

11.3.1 BASIC MODELLING APPROACHES

Based on the walls template, create a system family type for each type of wall cladding, and place the individual object in the designed location to the required alignment and top and base levels.

The relevant Information that can be extracted from the parameters includes length, unconnected height (height), area, etc.



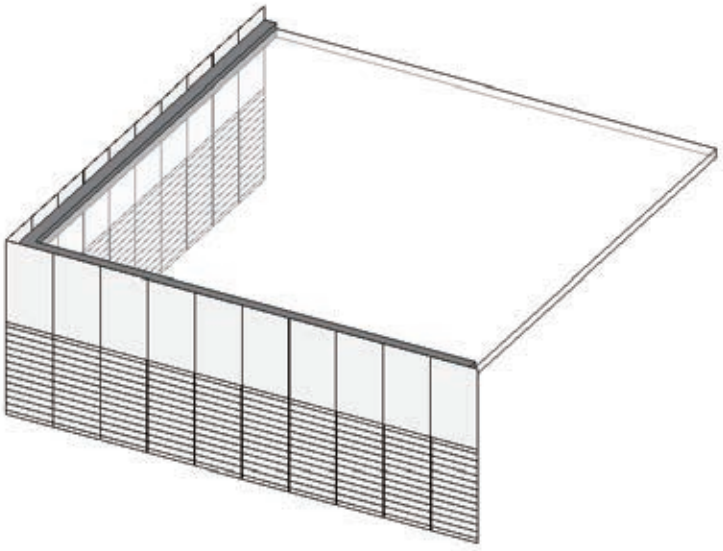


Figure 11.3.1 3D View of Wall Cladding

11.3.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Wall cladding marks.
2. Materials, qualities, construction and surface finishes of claddings, and backings (if any).
3. Dimensional descriptions of claddings.
4. Vertical/horizontal/sloping (> 15° from horizontal)/curved.
5. Opening types – openable windows/glazed doors/louvres/protective bearers/others.

11.3.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of wall cladding, create a schedule with the following fields:

<Wall Cladding Schedule>

A	B	C	D	E	F
Family	Type	Mark	Length	Unconnected Height	Area
Curtain Wall	CUW-WCL-PQS-ALUM_T50-00	MW01	10000	3720	37.20
Curtain Wall	CUW-WCL-PQS-ALUM_T50-00	MW01	10000	3720	37.20
Grand total: 2					74.40

Note:

- When creating the relevant schedule, while the family name “curtain wall” is still being used, the schedule title should be revised from “Curtain Wall Schedule” to “Wall Cladding Schedule”.
- According to HKSMM5, wall cladding area is measured based on its exposed faces.

Adjust for the following as necessary:

- Length, depending on whether the profile setting matches the method of measurement.

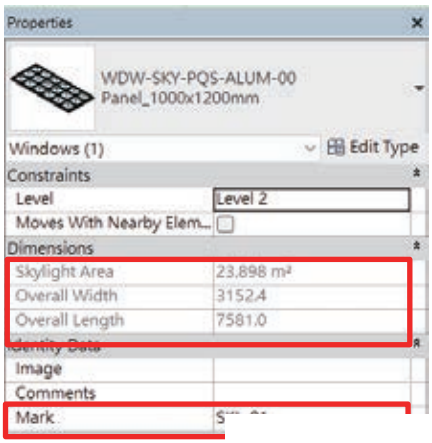
11.4 SKYLIGHTS

11.4.1 BASIC MODELLING APPROACHES

Based on the windows template, create a loadable family type for each type and bay size of skylights, and place the individual object in the designed location to the required area.

Adopt parametric modelling such that the model geometry will be changed accordingly when the dimensional values are modified. This can avoid inconsistency between geometrical and non-geometrical information.

The relevant information that can be extracted from the parameters includes number, length and width of skylight panels, overall length, width and area of skylight, etc.



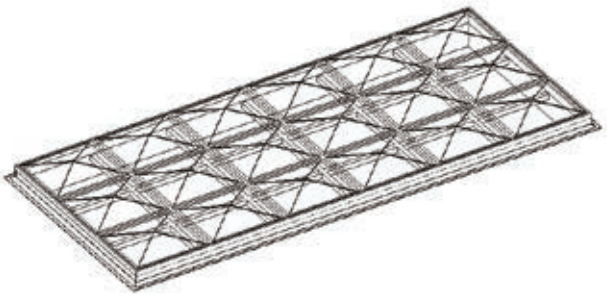


Figure 11. 4.1 – 3D View of Skylight

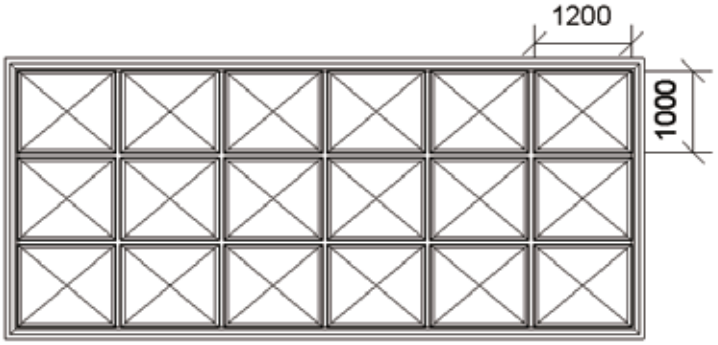

Figure 11.4.2 – Plan View of Skylight

11.4.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Skylight marks.
2. Materials, qualities, construction and surface finishes of framing members.
3. Overall sizes.
4. Types and thicknesses of glass panels.
5. Structural glazing system.
6. Horizontal/sloping (> 15° from horizontal)/curved.

This sample model has not included:

a. Fixing details to host.

11.4.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of skylights, create a schedule with the following field:

<Skylight Schedule>

A	B	C	D	E	F
Family	Type	Mark	Overall Length	Overall Width	Skylight Area
WDW-SKY-PQS-ALUM-00	Panel_1000x1200mm	SKL-01	7581	3152	23.90

Note:

- When creating the relevant schedule, while the family name “window” is still being used, the schedule title should be revised from “Window Schedule” to “Skylight Schedule”.
- According to HKSMM5, skylight area is measured based on its exposed faces.

Adjust for the following as necessary:

- Nil.

11.5 GLAZED COVERED WALKWAYS

11.5.1 BASIC MODELLING APPROACHES

Based on one of the generic model templates, create a loadable family type for each type and size of covered walkways, and place the individual object in the designed location.

Adopt parametric modelling such that the model geometry will be changed accordingly when the dimensional values are modified. This can avoid inconsistency between geometrical and non-geometrical information.

The dimensions stated in the Type Name should be the overall dimensions of the object.

The relevant information that can be extracted from the parameters includes overall length and width, etc.

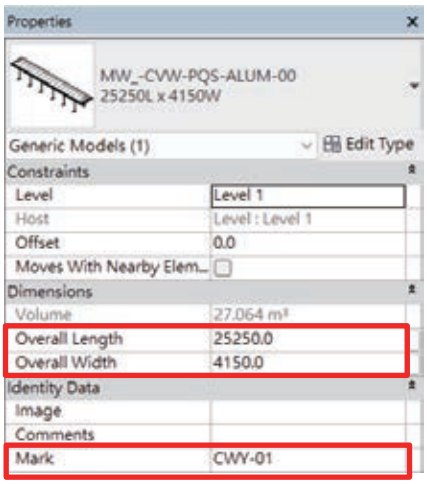

Figure 11.5.1 – 3D View of Glazed Covered Walkway

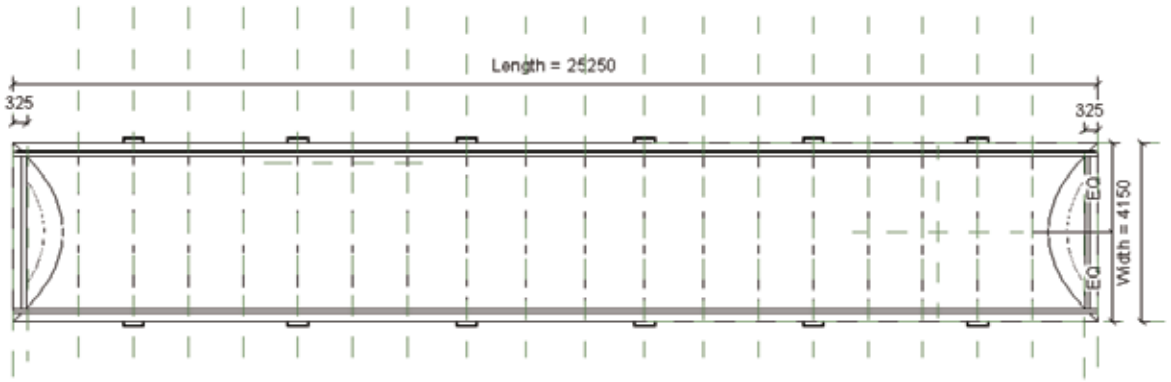

Figure 11.5.2 – Plan View of Glazed Covered Walkway

11.5.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Covered walkway marks.
2. Materials, qualities, construction and surface finishes of framing members.
3. Overall sizes.
4. Types and thicknesses of glass/polycarbonate panels; flat or curved.
5. Structural glazing system.

This sample model has not included:

a. Foundation details of supports.

11.5.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of glazed covered walkways, create a schedule with the following fields:

<Covered Walkway Schedule>

A	B	C	D	E	F
Family	Type	Mark	Overall Length	Overall Width	Count
MW_-CVW-PQS-ALUM-00	25250L x 4150W	CWY-01	25250	4150	1

Note:

- According to HKSMM5, glazed covered walkway is measured along its centre line if measured by length. Otherwise, they are measured by numbers.

Adjust for the following as necessary:

- Nil.

12.1 WINDOWS

12.1.1 BASIC MODELLING APPROACHES

Based on the windows template, create a loadable family type for each type and size of windows, and place the individual object in the designed location.

The relevant information that can be extracted from the parameters includes width, height, sill height, etc.

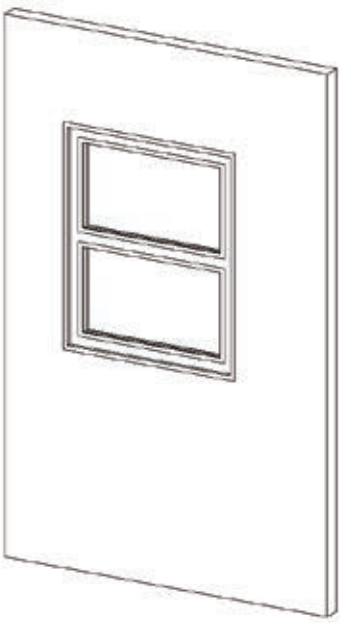

Figure 12.1.1 – 3D View of Window

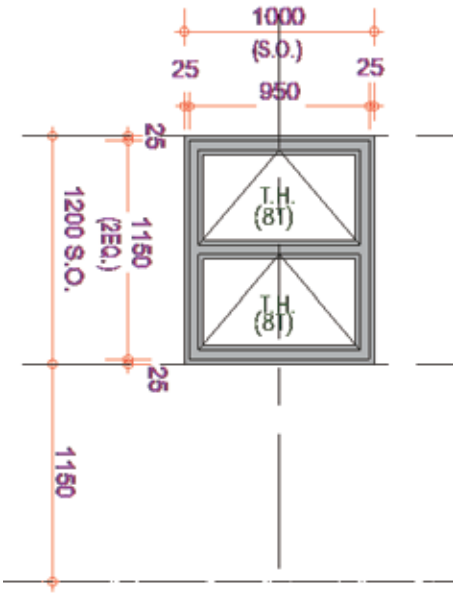

Figure 12.1.2 – Elevation View of Window

12.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Window marks.
2. Materials, qualities, construction and surface finishes of framing members.
3. Structural opening sizes.
4. Overall window sizes.
5. Types and thicknesses of glass panels.
6. Ironmongery.
7. Fire resistance rating.

12.1.3 QUANTITY TAKE-OFF GUIDELINES

For the measurement of windows, create a schedule with the following fields:

<Window Schedule>

A	B	C	D	E	F	G
Level	Family	Type	Mark	Width	Height	Count
2F(T1)	WDW-CSM-PQS-ALUM-00	W16_950x1150mm	W16	1000 mm	1200 mm	1

Note:

- Overall window size is used for describing the window.
- Structural opening size is used for measurements related to the opening size.

Adjust for the following as necessary:

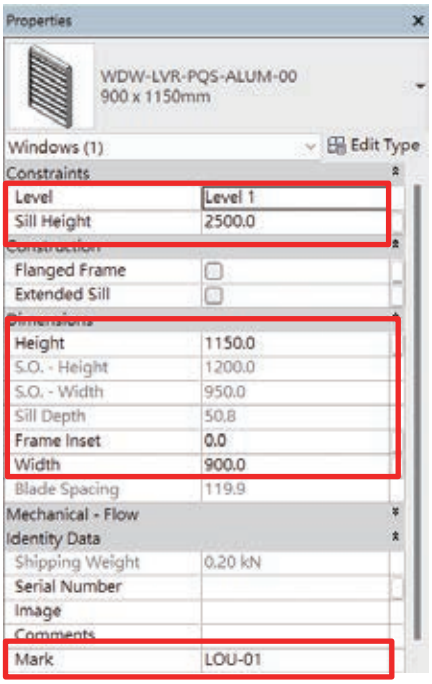
- Nil.

12.2 LOUVRES

12.2.1 BASIC MODELLING APPROACHES

Based on the windows template create a loadable family type for each type and size of louvres, and place the individual object in the designed location.

The relevant information that can be extracted from the parameters includes width, height, sill height, etc.



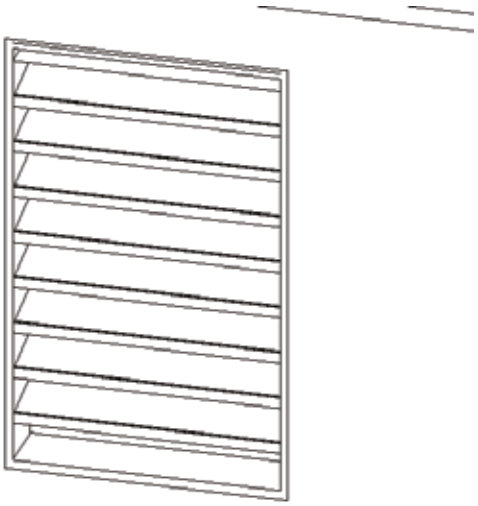


Figure 12.2.1 – 3D View of Louvre (external side)

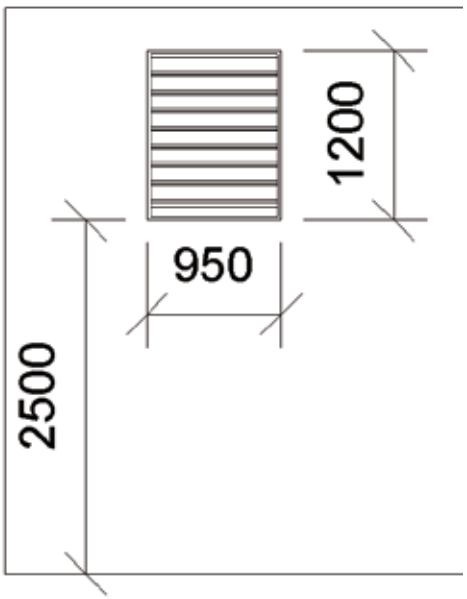

Figure 12.2.2 – Elevation View of Louvre

12.3.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Louvre marks.
2. Louvre types: weatherproof/fixed/adjustable.
3. Materials, qualities, construction and surface finishes of framing and blading members.
4. Structural opening sizes.
5. Overall louvre sizes.
6. Ironmongery.
7. Fire resistance rating.

12.2.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of louvres, create a schedule with the following fields:

<Louvre Schedule>

A	B	C	D	E	F
Family	Type	Mark	Width	Height	Count
WDW-LVR-PQS-ALUM-00	900 x 1150mm	LOU-01	900	1150	1

Note:

- Overall louvre size is used for describing the louvre.
- Structural opening size is used for measurements related to the opening size.

For measurement of paint/finishes around sides of openings, use paint tool:

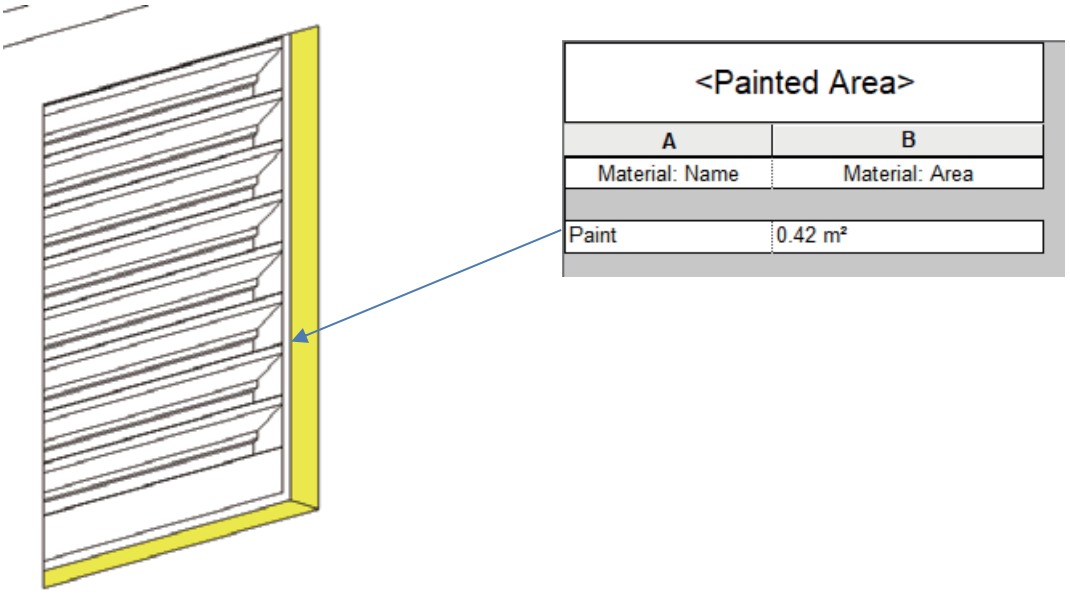

Figure 12.2.3 – 3D View of Louvre (internal side)

Adjust for the following as necessary:

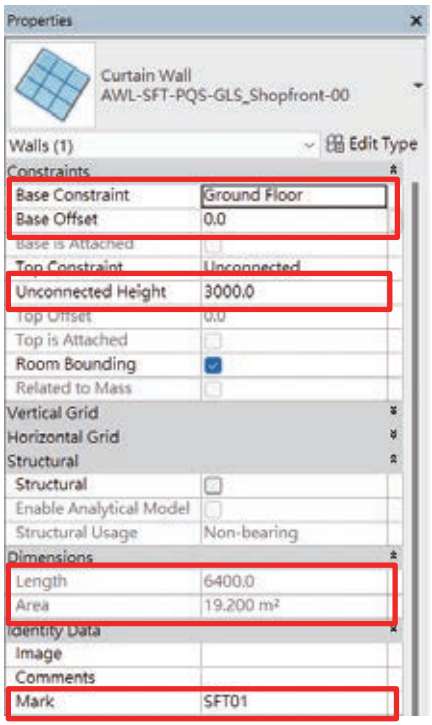
- Nil.

12.3 SHOP FRONTS

12.3.1 BASIC MODELLING APPROACHES

Based on the curtain panels template, create a loadable family type for each type and height of shop front, and place the individual object in the designed location to the required length.

The relevant information that can be extracted from the parameters includes panel width, height, shopfront length, area, etc.



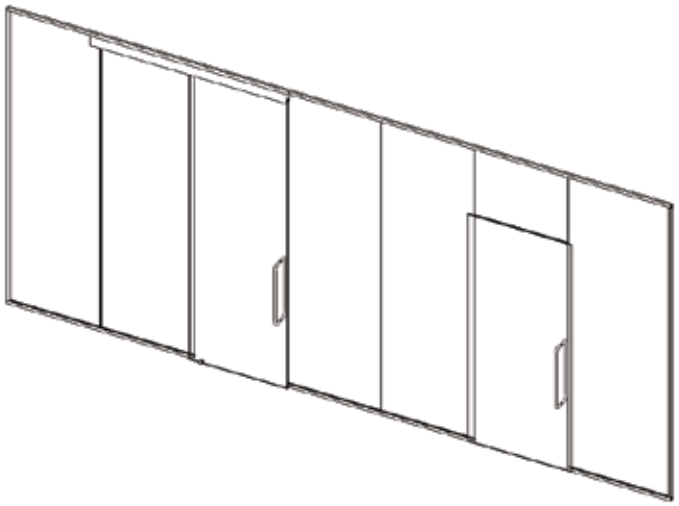


Figure 12.3.1 – 3D View of Shop Front

12.3.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Shop front marks.
2. Materials, qualities, construction and surface finishes of framing members.
3. Overall shopfront sizes.
4. Types and thicknesses of glass panels.
5. Any glazed doors or other openings.
6. Ironmongery.
7. Any sloping/curved surfaces.

12.3.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of shop fronts, create a schedule with the following fields:

<Shop Front Schedule>

A	B	C	D	E	F
Family	Type	Mark	Length	Unconnected Height	Area
Curtain Wall	AWL-SFT-PQS-GLS_Shopfront-00	SFT01	6400	3000	19.20

Note:

- The descriptions of the quantities should be clear as to the meaning of the shop front heights when there are false ceilings and supporting frames above false ceilings.

Adjust for the following as necessary:

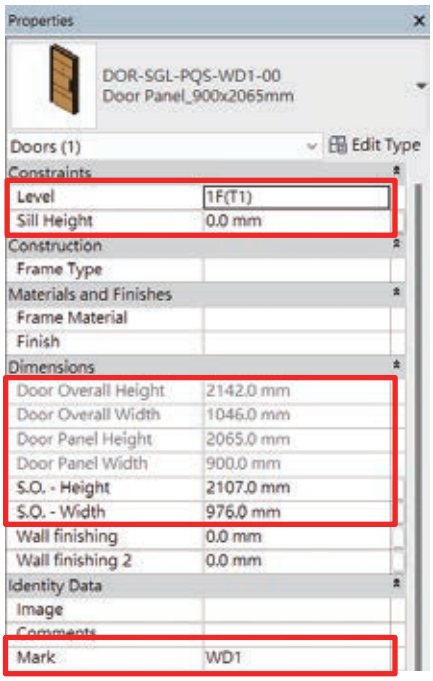
- Extra over shop fronts for glazed doors.
- Ironmongery for glazed doors if measured separately.

13.1 TIMBER DOORS

13.1.1 BASIC MODELLING APPROACHES

Based on the doors template, create a loadable family type for each type and size of timber doors, and place the individual object in the designed location.

The relevant information that can be extracted from the parameters includes structural opening width and height, door overall width and height, door panel width and height, sill height, etc.



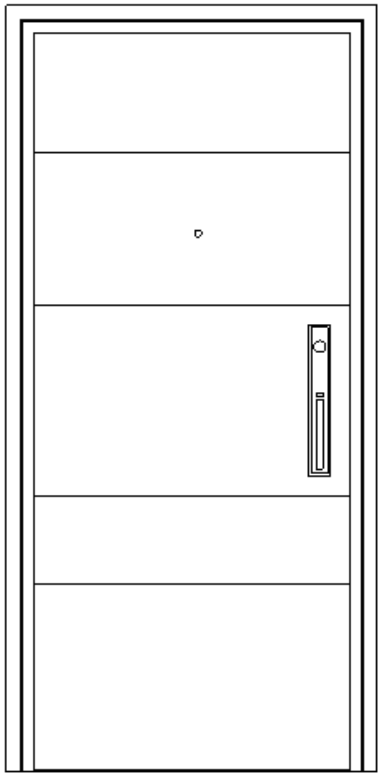


Figure 13.1.1 – Front Elevation of Timber Door

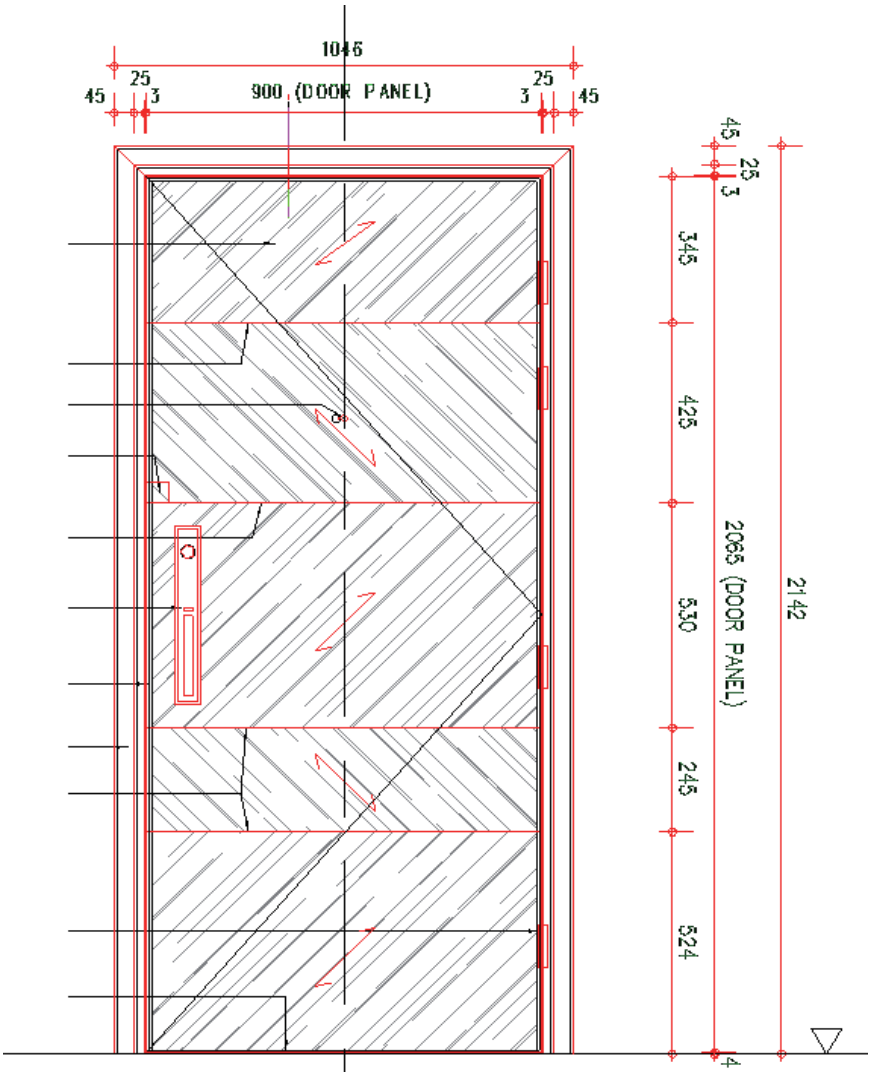

Figure 13.1.2 – Door Details

13.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Timber door marks.
2. Door types – single-leaf/double-leaf/swinging/sliding/folding.
3. Materials, qualities, construction, and surface finishes of doors.
4. Structural opening sizes.
5. Overall sizes.
6. Sizes and thicknesses of door panels.
7. Cross-sectional sizes of door frames/linings and architraves.
8. Glazed panels and louvres (if any) and their dimensions.
9. Wicket doors (if any) and their dimensions.
10. Fire resistance ratings and sound reduction ratings (if any).
11. Ironmongery or, if specially specified, ironmongery schedule and marks.

13.1.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of timber doors, create a schedule with the following fields:

<Door Schedule>

A	B	C	D	E	F	G
Family	Type	Mark	Door Overall Width	Door Overall Height	S.O. - Width	S.O. - Height
DOR-SGL-PQS-WD1-00	Door Panel_900x2065mm	WD1	1046 mm	2142 mm	976 mm	2107 mm

H	I	J	K
Door Panel Width	Door Panel Height	Fire Rating	Count
900 mm	2065 mm	60mins	1

Note:

- The descriptions of the quantities should be clear as to the meaning of the overall size.

Adjust for the following as necessary:

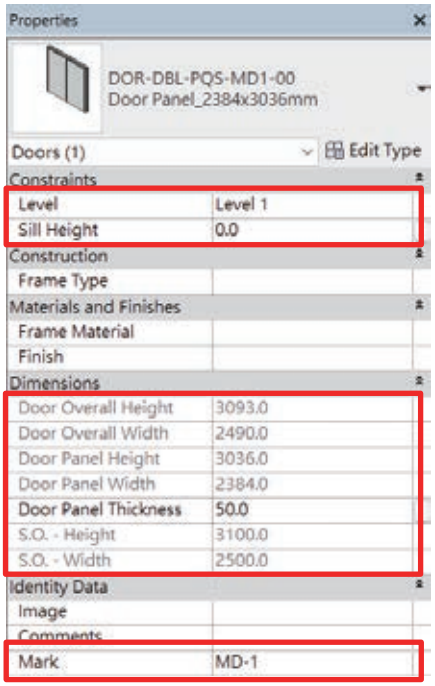
- Nil.

13.2 METAL DOORS

13.2.1 BASIC MODELLING APPROACHES

Based on the doors template, create a loadable family type for each type and size of metal doors, and place the individual object in the designed location.

The relevant information that can be extracted from the parameters includes structural opening width and height, door and frame overall width and height, door panel width and height, sill height, etc.



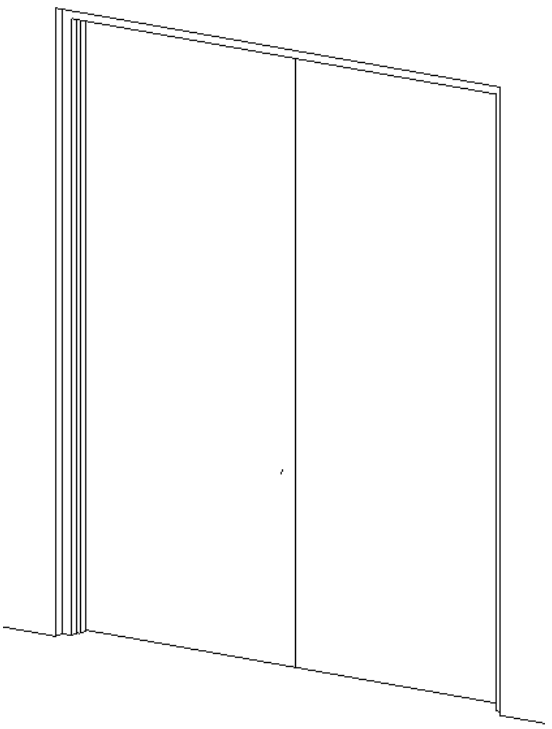


Figure 13–.2.1 - 3D View of Metal Door

13.2.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Metal door marks.
2. Door types – single-leaf/double-leaf/ swinging/ sliding/folding.
3. Materials, qualities, construction and surface finishes of door and frames.
4. Overall size.
5. Sizes and thicknesses of door panels.
6. Cross-sectional sizes and thicknesses of door frames/linings and architraves.
7. Glazed panels and louvres (if any) and their dimensions.
8. Wicket doors (if any) and their dimensions.
9. Fire resistance ratings and sound reduction ratings (if any).
10. Ironmongery or, of specially specified, ironmongery schedule and ironmongery marks.

13.2.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of metal doors, create a schedule with the following fields:

<Door Schedule>

A	B	C	D	E	F	G
Family	Type	Mark	S.O. - Width	S.O. - Height	Door Overall Width	Door Overall Height
DOR-DBL-PQS-MD1-00	Door Panel_2384x3036mm	MD-1	2500	3100	2490	3093

H	I	J	K
Door Panel Width	Door Panel Height	Fire Rating	Count
2384	3036	up to 240 minutes	1

Note:

- The descriptions of the quantities should be clear as to the meaning of the overall size.

Adjust for the following as necessary:

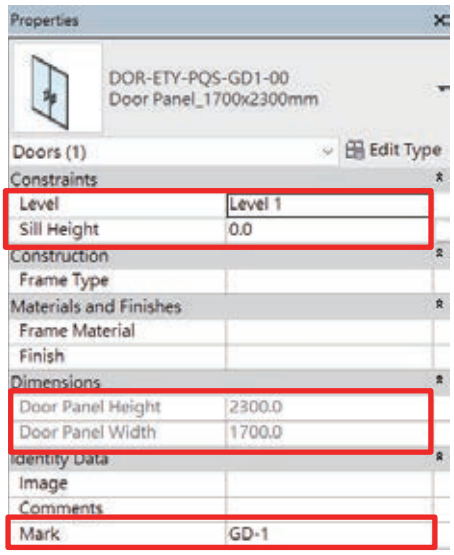
- Nil.

13.3 GLAZED DOORS

13.3.1 BASIC MODELLING APPROACHES

Based on the doors template, create a loadable family type for each type and size of glazed doors, and place the individual object in the designed location.

The relevant information that can be extracted from the parameters includes structural opening width and height, door panel width and height, sill height, etc.



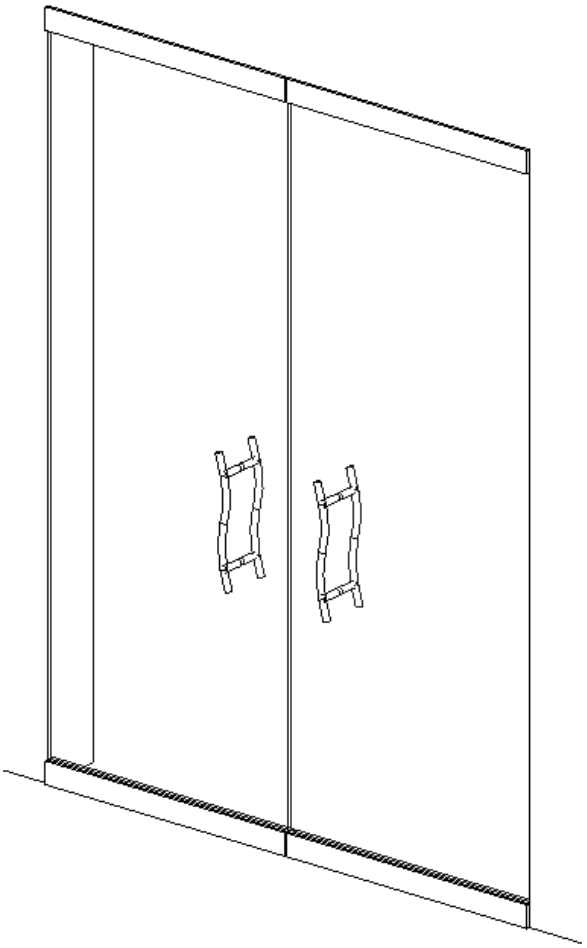


Figure 13.3.1 – 3D View of Glazed Door

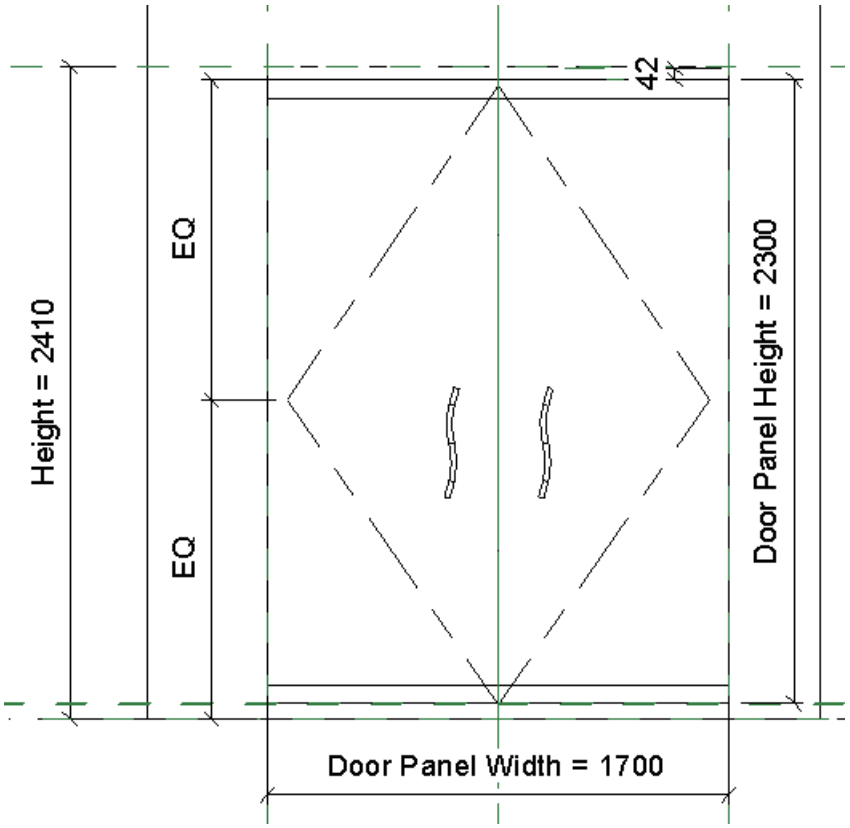

Figure 13.3.2 – Elevation View of Glazed Door

13.3.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Glazed door marks.
2. Door types – single-leaf/double-leaf/swinging/sliding/folding.
3. Materials, qualities, construction and surface finishes of doors.
4. Structural opening sizes.
5. Overall sizes.
6. Sizes and thicknesses of glass door panels.
7. Cross-sectional sizes and thicknesses of door frames/linings and architraves (if any).
8. Fire resistance ratings (if any).
9. Ironmongery or, if specially specified, ironmongery schedule and marks.

13.3.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of glazed doors, create a schedule with the following fields:

<Door Schedule>

A	B	C	D	E	F
Family	Type	Mark	Door Panel Width	Door Panel Height	Count
DOR-ETY-PQS-GD1-00	Door Panel_1700x2300mm	GD-1	1700	2300	1

Adjust for the following as necessary:

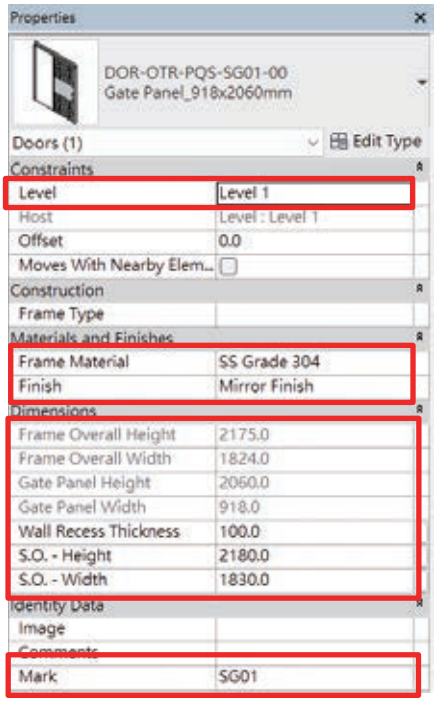
- Nil.

13.4 GATES

13.4.1 BASIC MODELLING APPROACHES

Based on the doors template, create a loadable family type for each type and size of gates, and place the individual object in the designed location.

The relevant information that can be extracted from the parameters includes structural opening width and height, gate and frame overall width and height, door panel width and height, sill height, etc.



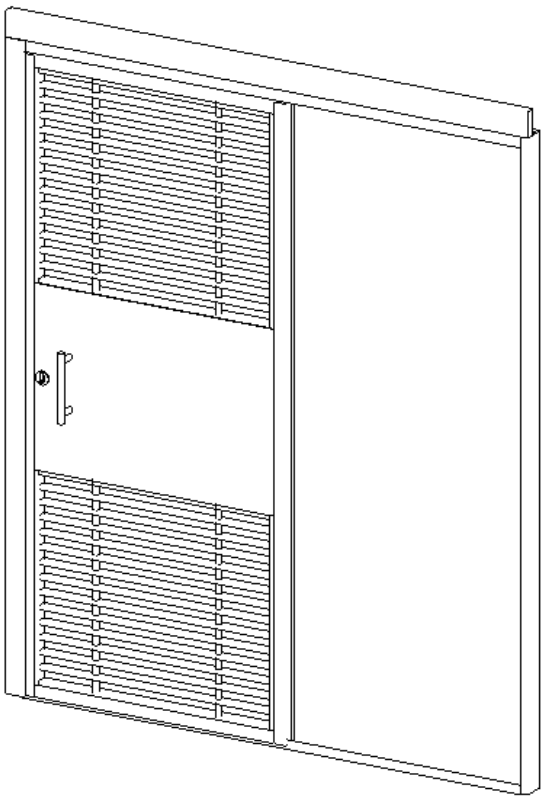


Figure 13.4.1 – 3D View of Grate

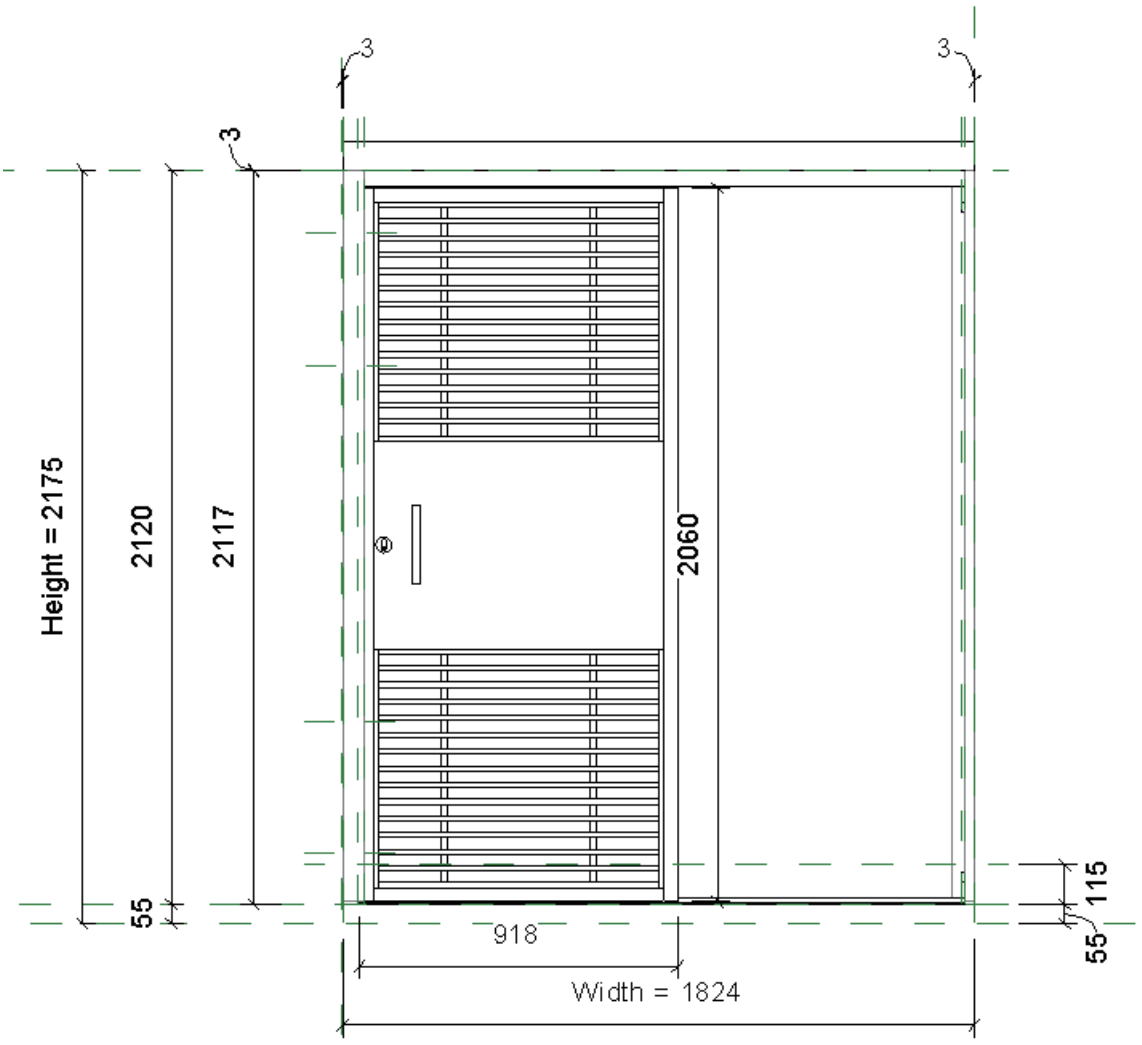

Figure 13.4.2 – Elevation of Gate

13.4.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Gate marks.
2. Gate types – single-leaf/double-leaf/swinging/sliding/folding.
3. Materials, qualities, construction and surface finishes of gates and frames.
4. Structural opening sizes.
5. Overall sizes.
6. Sizes and thicknesses of gate panels.
7. Cross-sectional sizes and thicknesses of sliding tracks and frames.
8. Glazed panels and louvres (if any) and their dimensions.
9. Wicket doors (if any) and their dimensions.
10. Manually operated or electrically operated.
11. Fire resistance ratings and sound reduction ratings (if any).
12. Ironmongery or, if specially specified, ironmongery schedule and marks.

13.4.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of gates, create a schedule with the following fields:

<Metal Gate Schedule>

A	B	C	D	E	F	G
Family	Type	Mark	S.O. - Width	S.O. - Height	Frame Overall Width	Frame Overall Height
DOR-OTR-PQS-SG01-00	Gate Panel_918x2060mm	SG01	1830	2180	1824	2175

H	I	J	K	L
Gate Panel Width	Gate Panel Height	Frame Material	Finish	Count
918	2060	SS Grade 304	Mirror Finish	1

Adjust for the following as necessary:

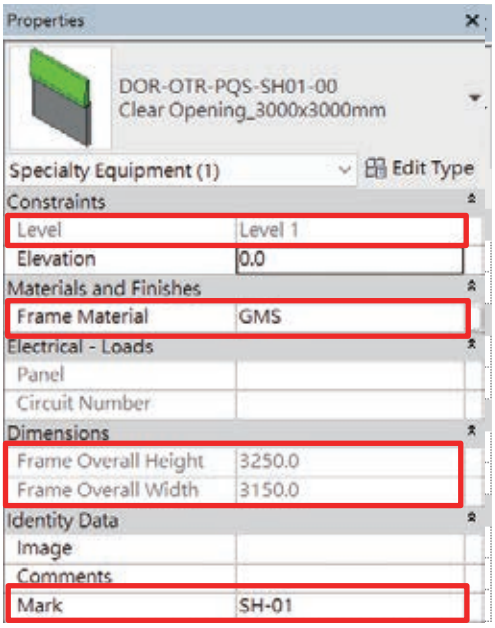
- Nil.

13.5 ROLLING SHUTTERS

13.5.1 BASIC MODELLING APPROACHES

Based on the specialty equipment template, create a loadable family type for each type and size of rolling shutters, and place the individual object in the designed location.

The relevant information that can be extracted from the parameters includes clear opening width and height, shutter, frame and hood overall width and height, etc.



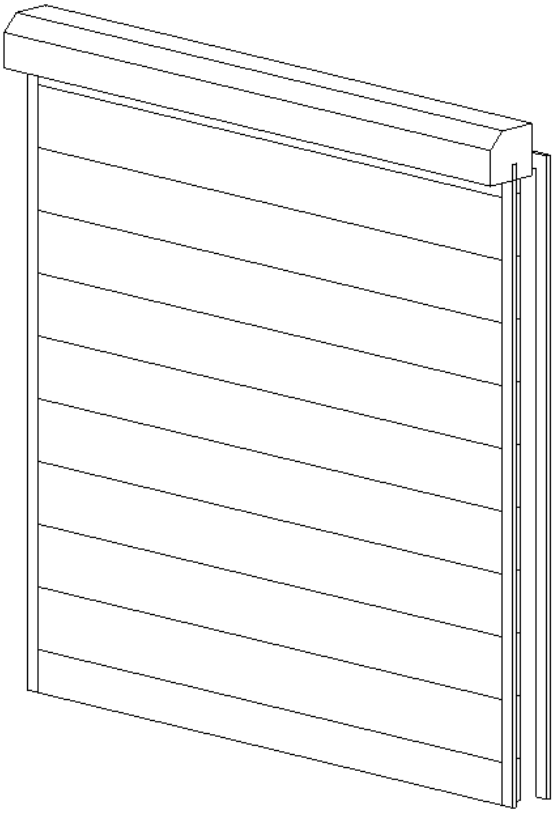


Figure 13.5.1 – 3D View of Rolling Shutter

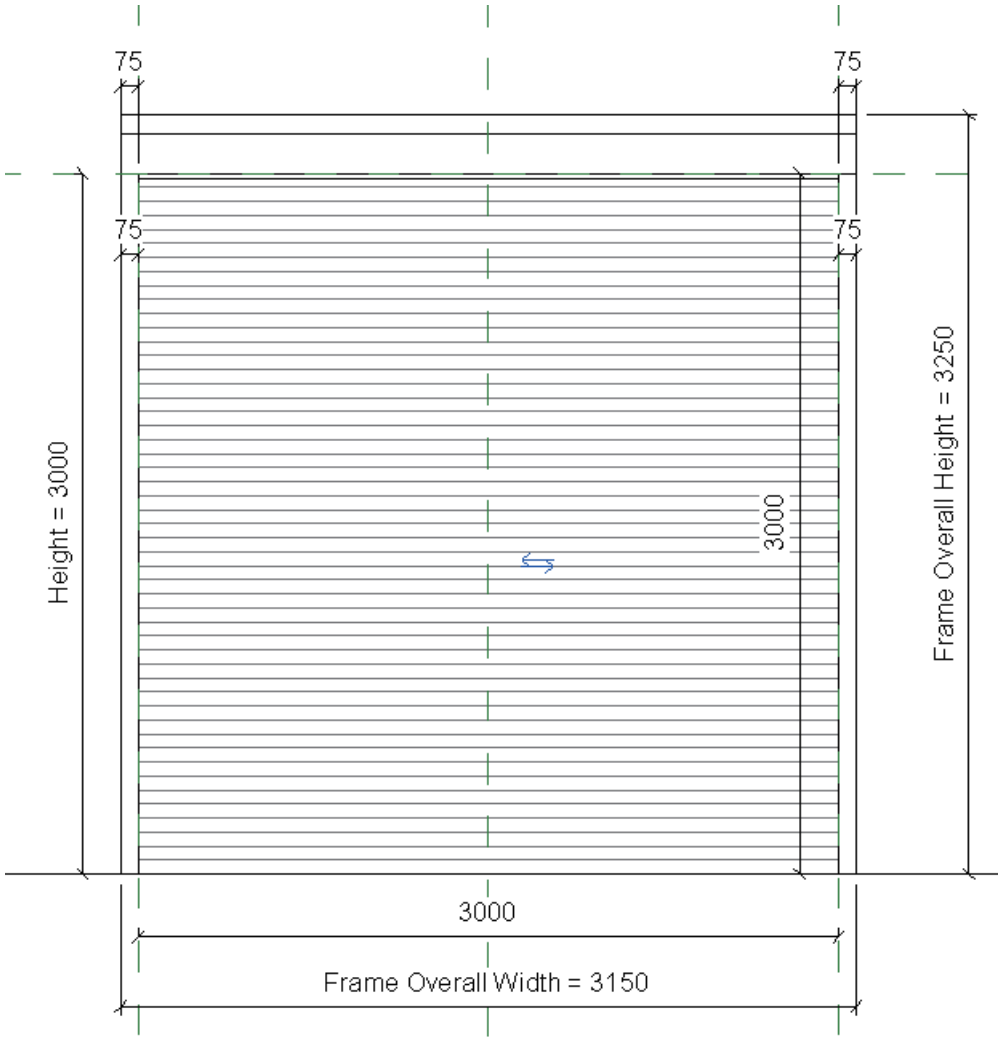

Figure 13.5.2 – Elevation of Rolling Shutter

13.5.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Rolling shutter marks.
2. Shutter types.
3. Materials, qualities, construction and surface finishes of shutters, frames and hoods..
4. Clear opening sizes.
5. Shutter, frame and hood overall sizes.
6. Cross-sectional sizes and thicknesses of shutters, frames and hoods.
7. Access/pass doors (if any) and their dimensions.
8. Horizontal or vertical.
9. Manually operated or electrically operated.
10. Fire resistance ratings (if any).
11. Ironmongery or, if specially specified, ironmongery schedule and marks.

13.5.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of rolling shutters, create a schedule with the following fields:

<Rolling Shutter Schedule>

A	B	C	D	E	F	G
Family	Type	Mark	Frame Overall Width	Frame Overall Height	Frame Material	Count
DOR-OTR-PQS-SH01-00	Clear Opening_3000x3000mm	SH-01	3150	3250	GMS	1

Note:

- The descriptions of the quantities should be clear as to the meaning of the overall size.

Adjust for the following as necessary:

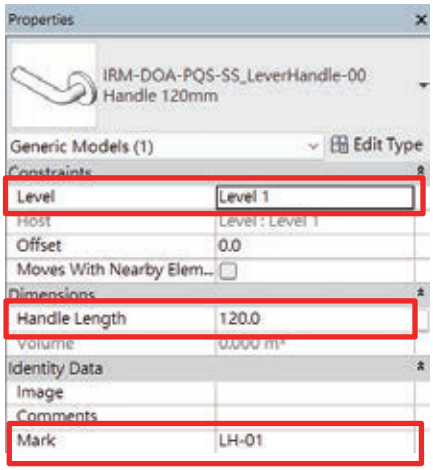
- Nil.

13.6 IRONMONGERY

13.6.1 BASIC MODELLING APPROACHES

Based on one of the generic model templates, create a loadable family type for each type and size of ironmongery, and place the individual object in the designed location.

The relevant information that can be extracted from the parameters includes size, etc.



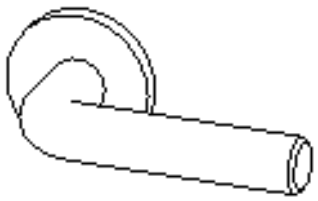


Figure 13.6.1 – 3D View of Handle

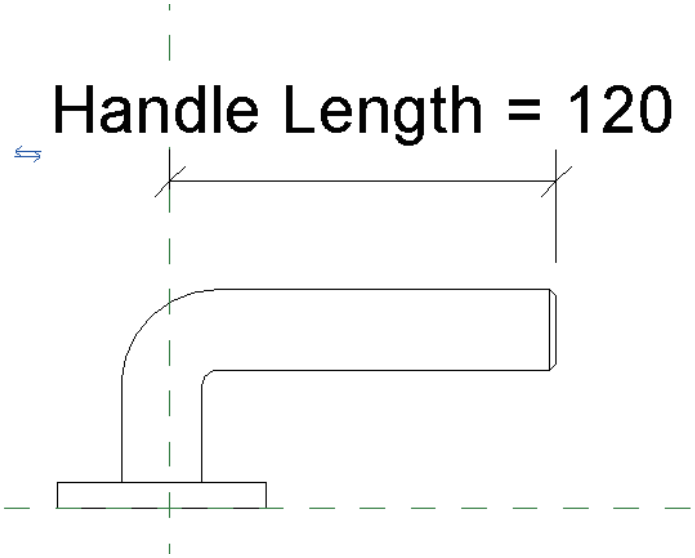

Figure 13.6.2 – Plan View of Handle

13.6.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Ironmongery marks.
2. Materials, qualities and surface finishes of ironmongery.
3. Sizes.
4. Brands and model numbers (if available).
5. Fixing backgrounds: timber/metal/glass/others (including door marks).

13.6.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of ironmongery, create a schedule with the following fields:

<Ironmongery Schedule>

A	B	C	D
Family	Type	Mark	Count
IRM-DOA-PQS-ALU_DoorCloser-00	Heavy Duty 200mm	DC-01	1
IRM-DOA-PQS-SS_PullHandle-00	Handle 150mm	PH-01	1
IRM-DOA-PQS-SS_StapleLock-00	300mm	SL-01	1
IRM-DOA-PQS-SS_LeverHandle-00	Handle 120mm	LH-01	1
IRM-DOA-PQS-ALU_DoorGuard-00	100mm	DG-01	1

Adjust for the following as necessary:

- Nil.

SECTION 14 – PARTITIONS

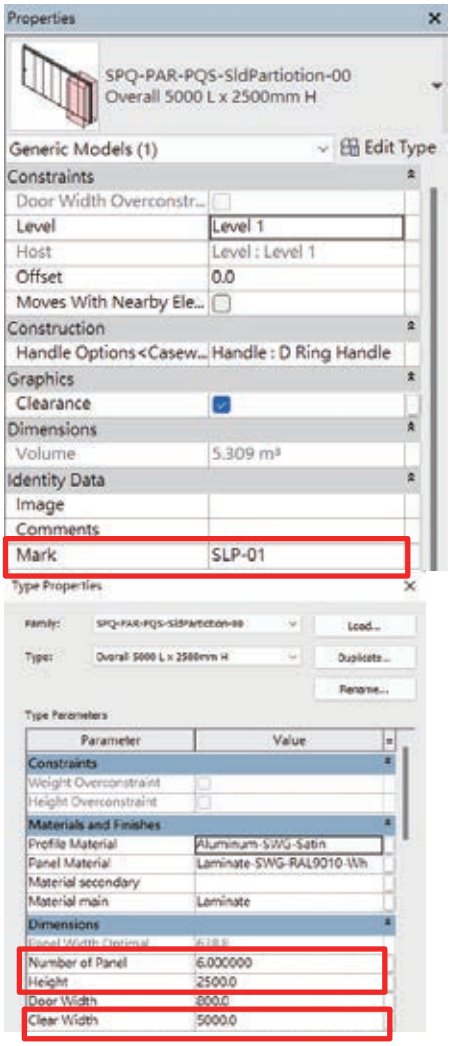
14.1 SLIDING AND FOLDING PARTITIONS

14.1.1 BASIC MODELLING APPROACHES

Based on one of the generic model templates, create a loadable family type for each type and size of sliding and folding partitions, and place the individual object in the designed location.

Adopt parametric modelling such that the model geometry will be changed accordingly when the dimensional values are modified. This can avoid inconsistency between geometrical and non-geometrical information.

The relevant information that can be extracted from the parameters includes length (clear width of opening to fill up), height (up to false ceiling or structural ceiling), panel number, etc.



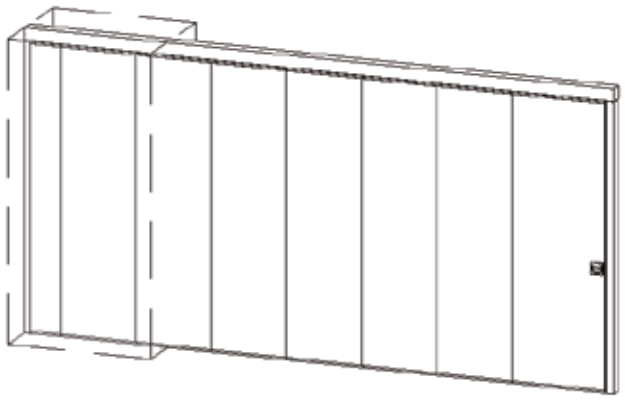


Figure 14.1.1 – 3D View of Sliding and Folding Partitions

14.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Sliding and folding partition marks (or location identifications).
2. Materials, qualities, construction and surface finishes of panels.
3. Overall sizes.
4. Overall height including open framing or unfinished partitioning above ceilings.
5. Access doors and pocket enclosures (if any) and their dimensions.
6. Required suspension systems, guide rails, floor guides and other accessories and fixings.
7. Manually operated or electrically operated.
8. Fire resistance ratings and sound reduction ratings.

14.1.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of sliding and folding partitions, create a schedule with the following fields:

<Sliding and Folding Partition Schedule>

A	B	C	D	E	F
Family	Type	Mark	Clear Width	Height	Count
SPQ-PAR-PQS-SldPartiotion-00	Overall 5000 L x 2500mm H	SLP-01	5000	2500	1

Adjust for the following as necessary:

- Nil.

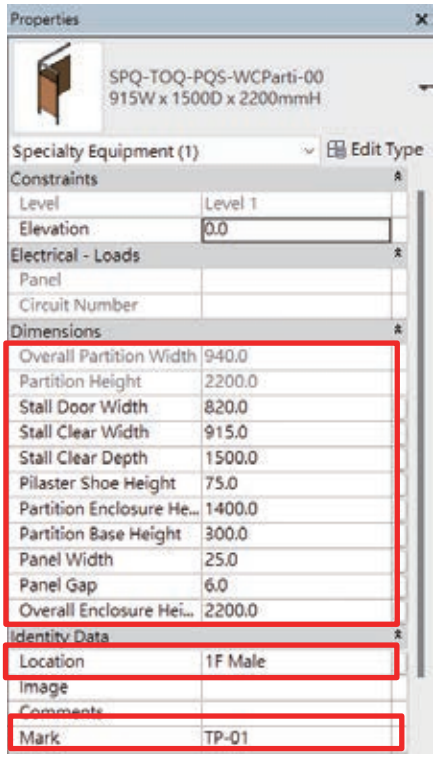
14.2 TOILET AND SHOWER CUBICLE PARTITIONS

14.2.1 BASIC MODELLING APPROACHES

Based on the specialty equipment template, create a loadable family type for each type and size of toilet and shower cubicles, and place the object in the designed location.

Adopt parametric modelling such that the model geometry will be changed accordingly when the dimensional values are modified. This can avoid inconsistency between geometrical and non-geometrical information.

The relevant information that can be extracted from the parameters includes overall size, number of bays, etc.



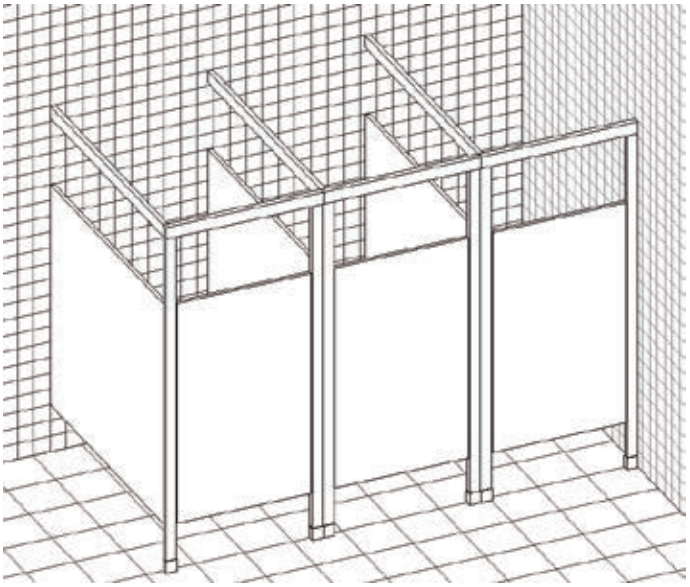


Figure 14.2.1 – 3D View of Toilet and Shower Cubicles

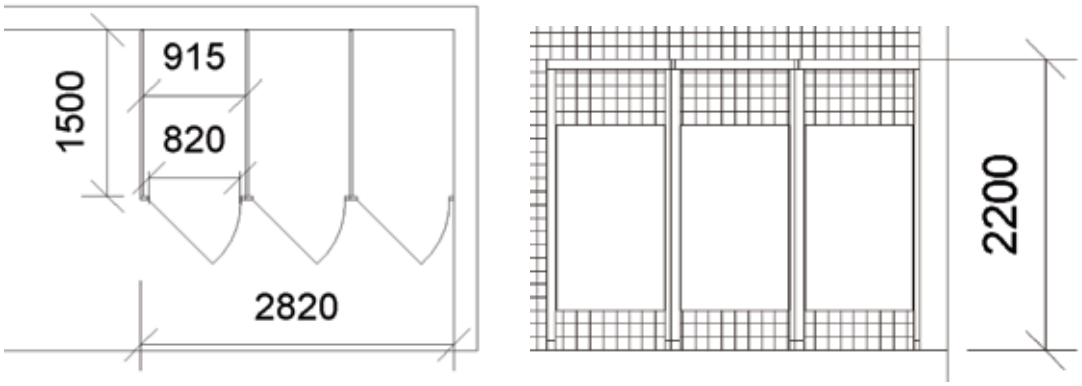

Figure 14.2.2 – Plan and Elevation View of Toilet and Shower Cubicles

14.2.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Toilet/shower cubicle marks (or location identifications).
2. Cubicle partitions or back wall panels type.
3. Materials, qualities, heights, thicknesses and surface finishes of cubicle partitions or back wall panels and doors.
4. Overall sizes.
5. Number of bays in cubicles or access panels in back wall panels.
6. Whether recessed/corner units.
7. Required accessories like indicator locks, knobs, hinges, coat hooks, door stoppers, toilet roller holders, trays and other fixings.

14.2.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of toilet and shower cubicles, create a schedule with the following fields:

<Toilet Cubicle Schedule>

A	B	C	D	E	F	G
Family	Type	Mark	Location	Overall Partition Width	Partition Height	Set
SPQ-TOQ-PQS-WCParti-00	915W x 1500D x 2200mmH	TP-01	1F Male	2820	2200	1
SPQ-TOQ-PQS-WCParti-00	915W x 1500D x 2200mmH	TP-02	2F Female	3760	2200	1

Note:

- The descriptions of the quantities should be clear as to the meaning of the overall size.

Adjust for the following as necessary:

- Nil.

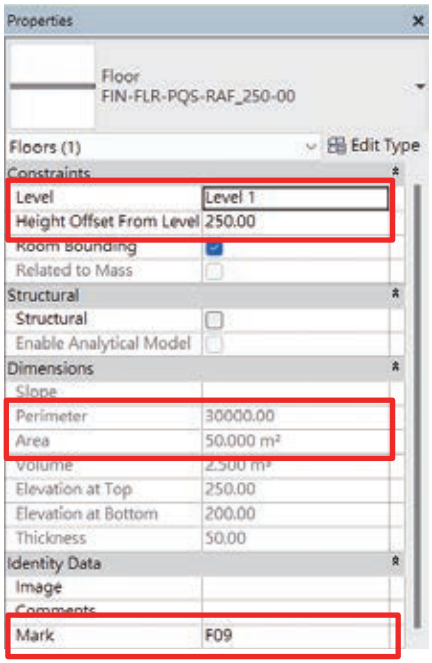
SECTION 15 – RAISED ACCESS FLOORS

15.1 RAISED ACCESS FLOORS

15.1.1 BASIC MODELLING APPROACHES

Based on the floors template, create a system family type for each type and height of raised access floor, and place the individual object in the designed location to the required boundary.

The relevant information that can be extracted from the parameters includes raised height, perimeter, area, etc.



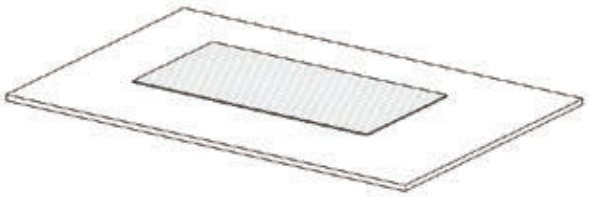


Figure 15.1.1 – 3D View of Raised access floors

Figure 15.1.2 – Elevation View of Raised access floors

15.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Raised access floor marks.
2. Materials, qualities and construction of raised access floors.
3. Thicknesses and modular sizes of panels.
4. Cover/top finishes of panels.
5. Heights of cavities from the top surfaces of subfloors to the underside of panels.

15.1.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of raised access floors, create a schedule with the following fields:

<Floor Schedule>

A	B	C	D	E	F	G	H
Family	Type	Mark	Level	Perimeter	Thickness	Height of Cavity	Area
Floor	FIN-FLR-PQS-RAF_250-00	F09	Level 1	30000.00	50.00	200.00	50.00 m²

Note:

- According to HKSMM5, raised access floor area is measured net based on its exposed faces.
- There is an alternative measurement rule of no deduction for voids ≤ 1.00 m^2.

Adjust for the following as necessary:

- Nil.

SECTION 16 – HANDRAILS, BALUSTRADES, LADDERS AND STAIRS

16.1 HANDRAILS

16.1.1 BASIC MODELLING APPROACHES

Staircase handrail is automatically generated when a stair is created or it can be placed on existing stair object.

Based on the railings template, create a system family type for each type and cross-sectional size of staircase handrails, and place the individual object in the designed location to the required alignment and length.

The relevant information that can be extracted from the parameter includes length (the total length includes both end extensions is required), height, etc.

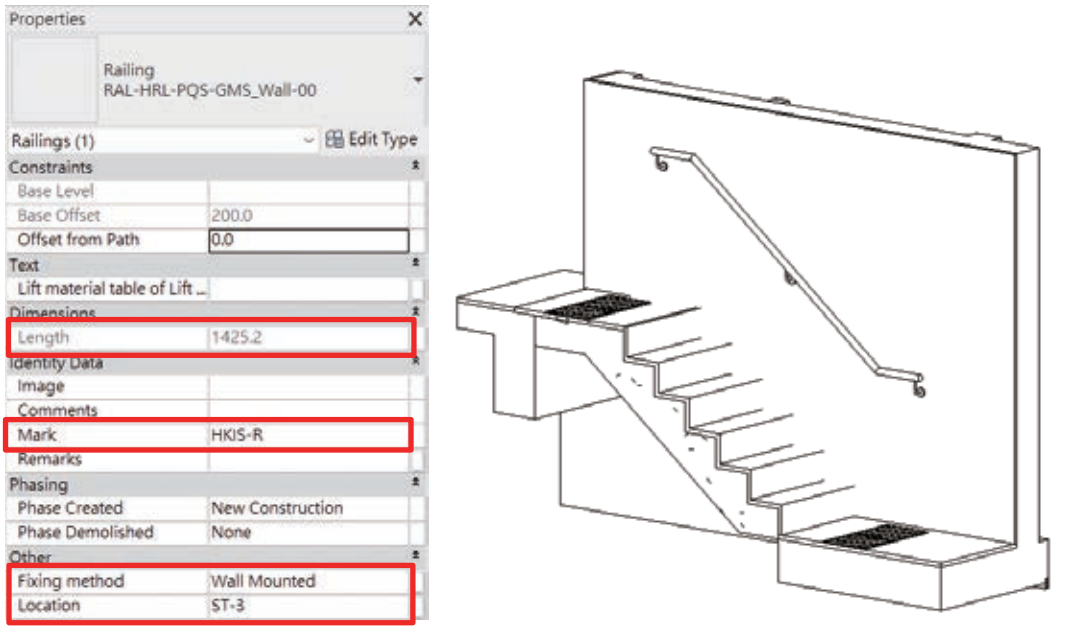

Figure 16.1.1 – 3D View of Handrail and Stair

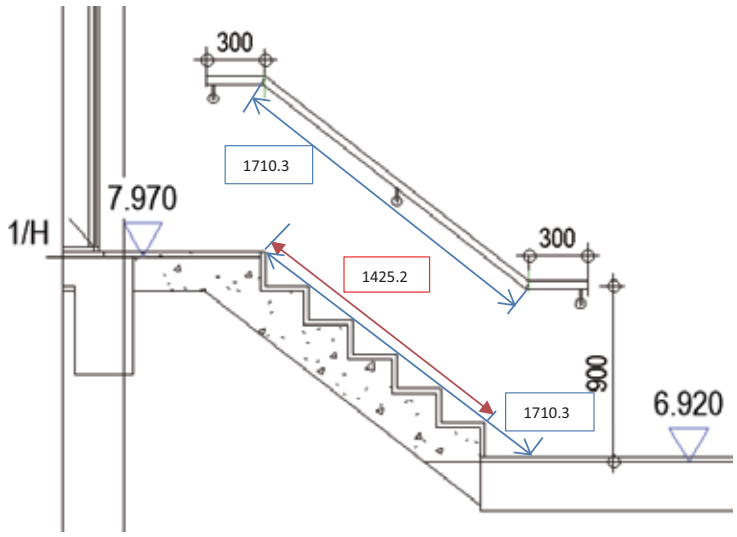

Figure 16.1.2 – Section of Handrail and Stair

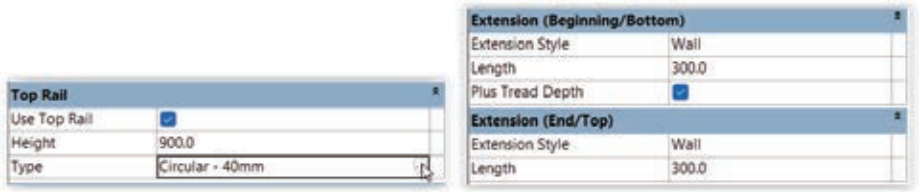
The top and bottom end extensions of 300 mm are set by clicking Top Rail: Type box in the Railing Type Property pallet to go to the Top Rail Type Property pallet, and defining as follows:



The "Plus Tread Depth" is also clicked so that the sloping part of the handrail is extended by one more tread depth to meet the design.

16.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Staircase handrail marks (or locational references).
2. Materials, qualities, construction, surface finishes and fixing methods.
3. Railing height and cross-sectional sizes of members.
4. Straight/curved.
5. Secondary handrails (if any).
6. Removable/openable portions (in any) including associated ironmongery.
7. Tactile indicators (if any).

16.1.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of staircase handrails, create a schedule with the following fields:

<Railing Schedule>

A	B	C	D	E	F	G	H	I	J
Family	Type	Description	Fixing method	Location	Mark	Length	Measured length	Extended length at both	Total Length
Railing	RAL-HRL-PGS-GMS_Wall-00	40x2mm thk GMS tubular	Wall Mounted	ST-3	HKIS-R	1425	1710	600	2310

Note:

- When creating the relevant schedule, while the family name “railing” is still being used, the schedule title should be revised from “Railing Schedule” to “Staircase Handrail Schedule”.

Set the following formula in the schedule:

- *Total Length = Measured Length (of rail) + Extended length at both ends.*

Note:

- When modelling staircase handrail using the above settings, the reported “Length” of the railing or handrail is based on the sloping length of the stair from the lowest riser to the highest riser only (1425 mm as shown above), excluding the lengths of the end extensions and the sloping length due to one more tread depth.
- The “Measured length” of 1710.3 mm is the sloping length measured and entered manually.
- The “Extended length at both ends” is set as a constant.
- The “Measured Length” can in fact be calculated by *“Length/No. of treads x (No. of treads + 1)”* (i.e. 1,425.2 / 5 x 6) = 1710.24 mm and called “Sloping Length”.
- If the staircase handrail length is adjusted by clicking the handrail modelled then clicking Modify > Edit Path, then the reported “Length” will be adjusted accordingly but still excluding the above. If the lengths of the end extensions are set to 0 and the one more tread depth is disabled, then the “Length” will be the correct total length.

Adjust for the following as necessary:

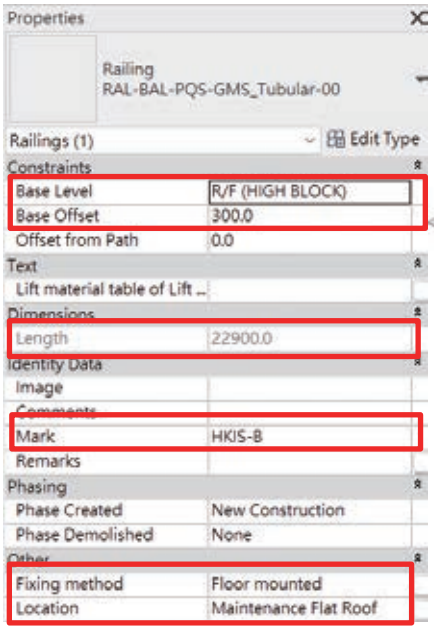
- Nil.

16.2 BALUSTRADES

16.2.1 BASIC MODELLING APPROACHES

Based on the railings template, create a system family type for each type and height of balustrades, and place the individual object in the designed location to the required alignment and length.

The relevant information that can be extracted from the parameters includes length, height, etc.



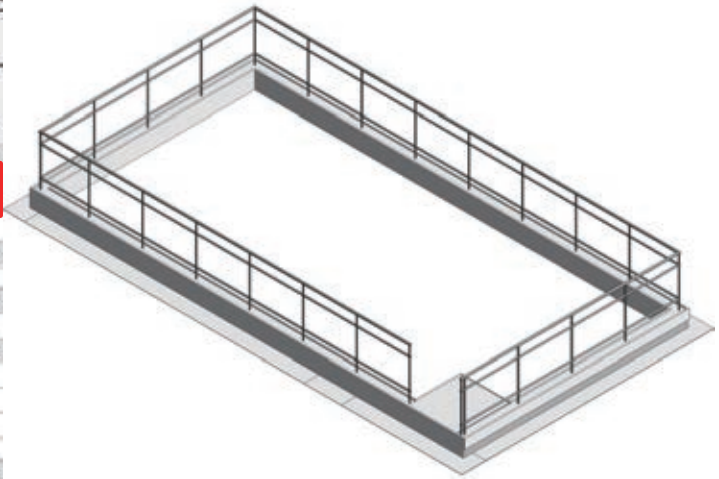


Figure 16.2.1 – 3D View of Balustrade

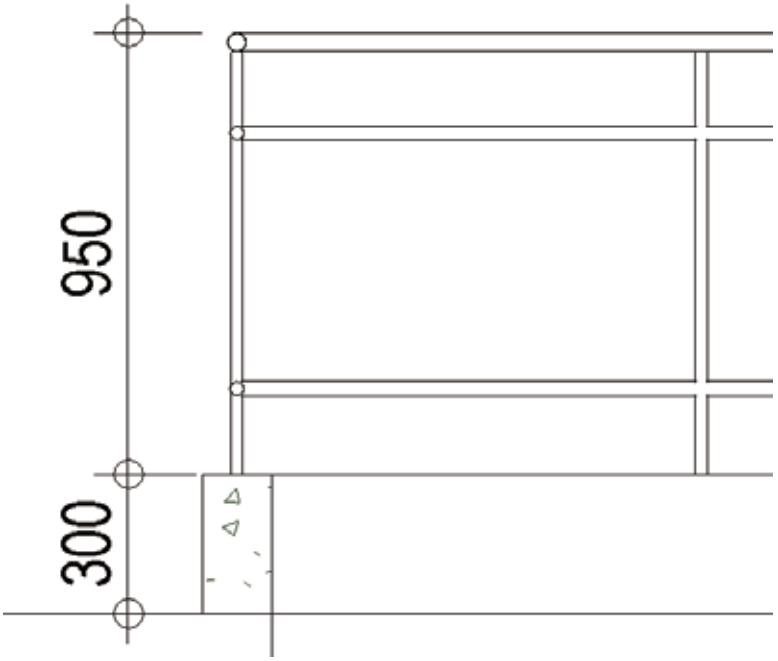

Figure 16.2.2 – Section of Balustrade

16.2.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Balustrade marks (or locational references).
2. Materials, qualities, construction, surface finishes and fixing methods.
3. Balustrade height and cross-sectional sizes of members.
4. Straight/curved.
5. Secondary handrails (if any).
6. Removable/openable portions (in any) including associated ironmongery.
7. Tactile indicators (if any).

16.2.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of balustrades, create a schedule with the following fields:

<Balustrades Schedule>

A	B	C	D	E	F	G	H	I
Family	Type	Description	Fixing method	Base Level	Location	Mark	Railing Height	Length
Railing	RAL-BAL-PGS-GMS_Tubular-00	40x2mm thk GMS tubular	Floor mounted	R/F (HIGH BLOCK)	Maintenance Flat Roof	HKIS-B	950	22900

Note:

- The effect of the lengths of the end extensions as described for staircase handrails still apply here because they all use the same Railing family.

Adjust for the following as necessary:

- Nil.

16.3 CAT LADDERS

16.3.1 BASIC MODELLING APPROACHES

Based on the specialty equipment template, create a loadable family type for each type and height of cat ladders, and place the individual object in the designed location.

The relevant information that can be extracted from the parameters includes dimensions of fabrication of component members, height etc.

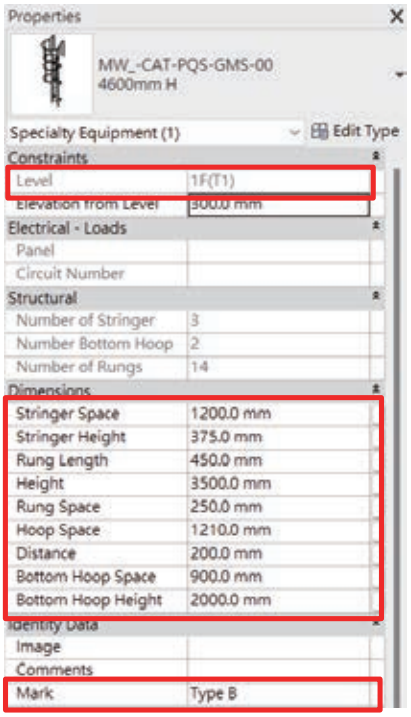

Figure 16.3.1 – 3D View of Cat Ladder

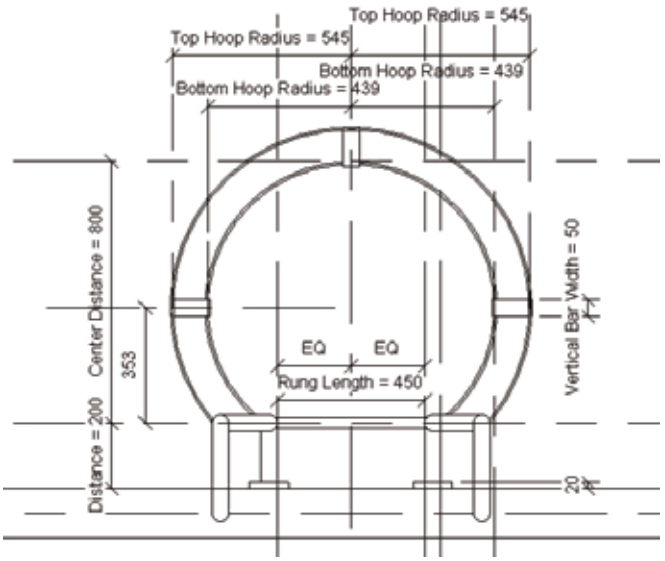

Figure 16.3.2 – Plan View of Cat Ladder

16.3.1 BASIC MODELLING APPROACHES

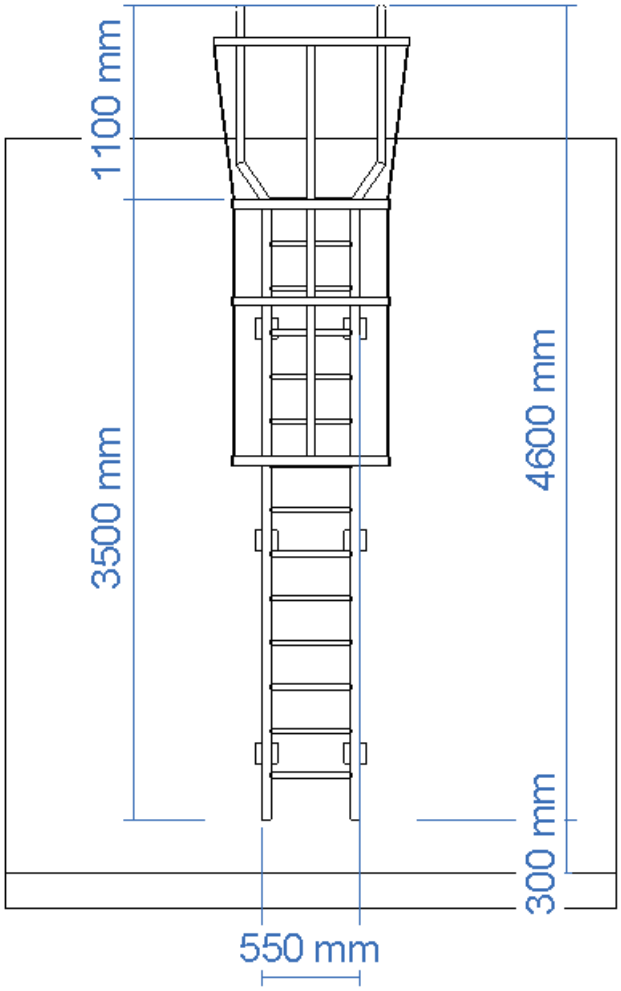

Figure 16.3.3 – Elevation of Cat Ladder

16.3.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Cat ladder marks (or locational references).
2. Materials, qualities, construction, surface finishes and fixing methods.
3. Widths and heights of cat ladders.
4. Sizes of members.
5. Any openable gates, hoop guards, lockable access doors, and rest platforms, with details.

16.3.3 QUANTITY TAKE-OFF GUIDELINES

For the measurement of cat ladders, create a schedule with the following fields:

<Cat Ladder Schedule>

A	B	C	D	E	F
Family	Type	Mark	Description	Level	Count
MW_-CAT-PQS-GMS-00	4600mm H	Type B	GMS cat ladder w/ hoop guards	1F(T1)	1

Adjust for the following as necessary:

- Nil.

16.4 STAIRS

16.4.1 BASIC MODELLING APPROACHES

Based on the stairs template, create a system family type for each type and size of assembled stairs, and place the individual object in the designed location to the required length and top and base levels.

The relevant information that can be extracted from the parameters includes actual number of risers, actual riser height, actual tread depth, etc.

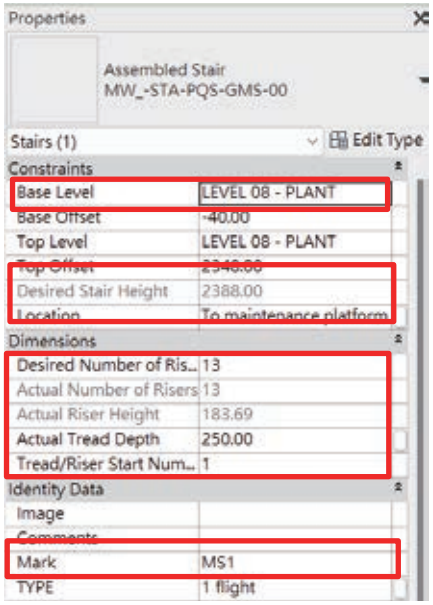

Figure 16.4.1 – 3D View of Metal Stair

Figure 16.4.2 – Plan View of Metal Stair

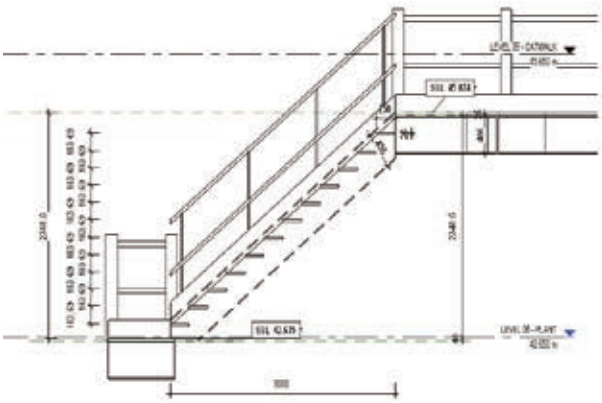

Figure 16.4.3 – Section View of Metal Stair

16.4.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Metal stair marks (or locational references).
2. Materials, qualities, construction, surface finishes and fixing methods.
3. Sizes of stairs and members.
4. Numbers of flights between landings and floors.
5. Fire resistance coatings (if required).

16.4.3 QUANTITY TAKE-OFF GUIDELINES

For the measurement of metal stairs, create a schedule with the following fields:

<Metal Stair Schedule>

A	B	C	D	E	F	G	H	I
Family	Type	Base Level	Top Level	Location	Description	Mark	Number of Risers	Count
Assembled Stair	MW_-STA-PQS-GMS-00	LEVEL 08 - PLANT	LEVEL 08 - PLANT	To maintenance platform	1360mm wide GMS stair	MS1	13	1
Grand total: 1								

Note:

- According to HKSMM5, handrails and balustrades are measured separately from stairs unless otherwise stated.

Adjust for the following as necessary:

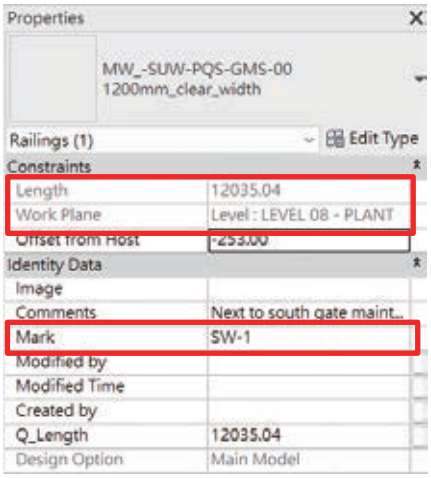
- Nil.

16.5 SUSPENDED WALKWAYS

16.5.1 BASIC MODELLING APPROACHES

Based on the railings template, create a loadable family type for each type and cross-sectional size of suspended walkways, and place the individual object in the designed location to the required alignment and length.

The relevant information that can be extracted from the parameters includes walkway length, width, height, etc.



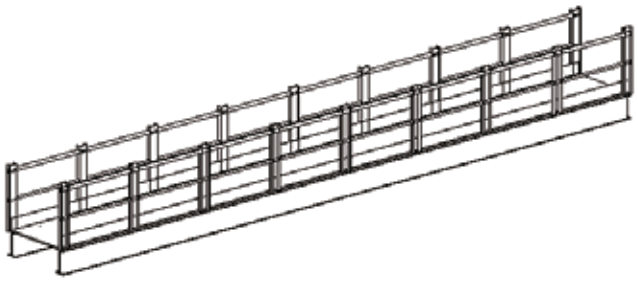


Figure 16.5.1 – 3D View of Suspended Walkway

Figure 16.5.2 – Elevation of Suspended Walkway

16.5.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Walkway marks (or locational references).
2. Materials, qualities, construction, surface finishes and fixing methods.
3. Widths of walkways and height of railings.
4. Sizes of members.
5. Fire resistance coatings (if required).

16.5.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of suspended walkways, create a schedule with the following fields:

<Supsended walkway Schedule>

A	B	C	D	E	F
Family	Type	Location	Mark	Length	Count
MW_-SUW-PQS-GMS-00	1200mm_clear_width	Next to south gate maintenance platform	SW-1	12035	1

Adjust for the following as necessary:

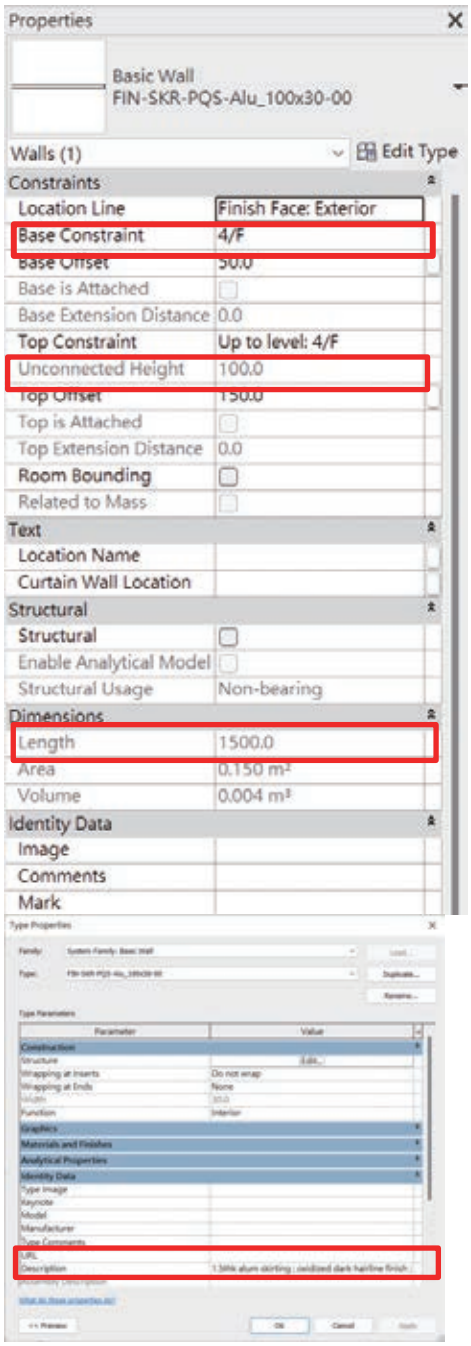
- Nil.

17.1 SKIRTINGS

17.1.1 BASIC MODELLING APPROACHES

Based on the walls template, create a system family type for each type and cross-sectional size of skirtings, and place the individual object in the designed location to the required alignment and length.

The relevant Information that can be extracted from the parameters includes length, unconnected height (skirting height), width (thickness), etc.



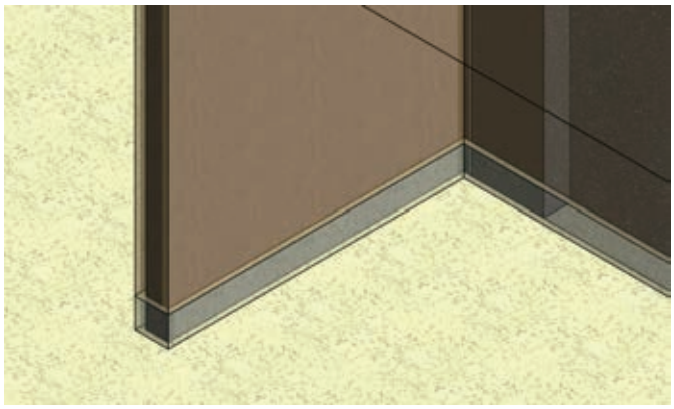


Figure 17.1.1 – 3D View of Metal Skirtings

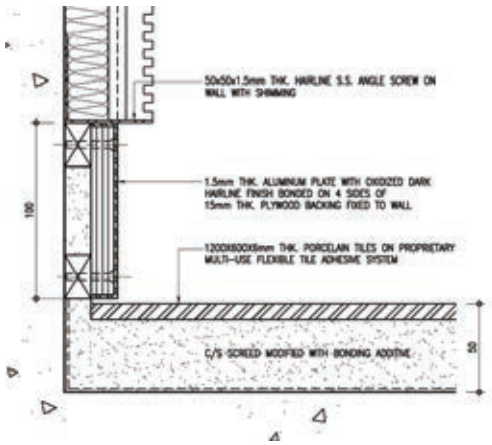

Figure 17.1.2 – Detail of Metal Skirtings

17.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Skirting marks (or locational references).
2. Materials, qualities, construction, surface finishes and fixing methods.
3. Overall heights and thicknesses of skirtings.
4. Straight/curved.

17.1.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of skirtings, create a schedule with the following fields:

<Skirting Schedule>

A	B	C	D	E
Type	Description	Base Constraint	Unconnected Height	Length
FIN-SKR-PQS-Alu_100x30-00	1.5thk alum skirting ; oxidized dark hairline finish ; 15thk plywood backing	4/F	100	0.85 m
FIN-SKR-PQS-Alu_100x30-00	1.5thk alum skirting ; oxidized dark hairline finish ; 15thk plywood backing	4/F	100	3.15 m
FIN-SKR-PQS-Alu_100x30-00	1.5thk alum skirting ; oxidized dark hairline finish ; 15thk plywood backing	4/F	100	3.16 m
FIN-SKR-PQS-Alu_100x30-00	1.5thk alum skirting ; oxidized dark hairline finish ; 15thk plywood backing	4/F	100	3.11 m
FIN-SKR-PQS-Alu_100x30-00	1.5thk alum skirting ; oxidized dark hairline finish ; 15thk plywood backing	4/F	100	1.48 m
FIN-SKR-PQS-Alu_100x30-00	1.5thk alum skirting ; oxidized dark hairline finish ; 15thk plywood backing	4/F	100	2.21 m
FIN-SKR-PQS-Alu_100x30-00	1.5thk alum skirting ; oxidized dark hairline finish ; 15thk plywood backing	4/F	100	1.50 m
FIN-SKR-PQS-Alu_100x30-00	1.5thk alum skirting ; oxidized dark hairline finish ; 15thk plywood backing	4/F	100	0.82 m
FIN-SKR-PQS-Alu_100x30-00	1.5thk alum skirting ; oxidized dark hairline finish ; 15thk plywood backing	4/F	100	1.48 m
FIN-SKR-PQS-Alu_100x30-00	1.5thk alum skirting ; oxidized dark hairline finish ; 15thk plywood backing	4/F	100	0.99 m
FIN-SKR-PQS-Alu_100x30-00	1.5thk alum skirting ; oxidized dark hairline finish ; 15thk plywood backing	4/F	100	0.99 m
FIN-SKR-PQS-Alu_100x30-00	1.5thk alum skirting ; oxidized dark hairline finish ; 15thk plywood backing	4/F	100	0.97 m
Grand total: 12				20.71 m

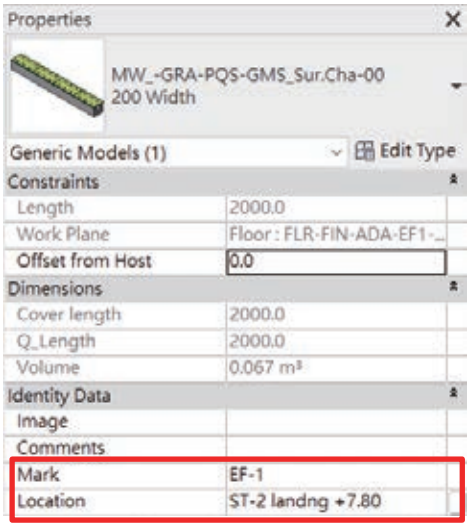
Adjust for the following as necessary:

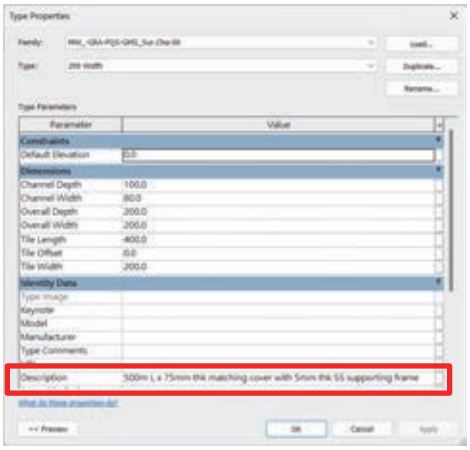
- Nil.

17.2 GRATINGS AND FRAMES TO FLOOR CHANNELS

17.2.1 BASIC MODELLING APPROACHES

Based on the generic models template, create a loadable family type for each type and cross-sectional size of gratings, and place the individual object in the designed location to the required alignment and length.





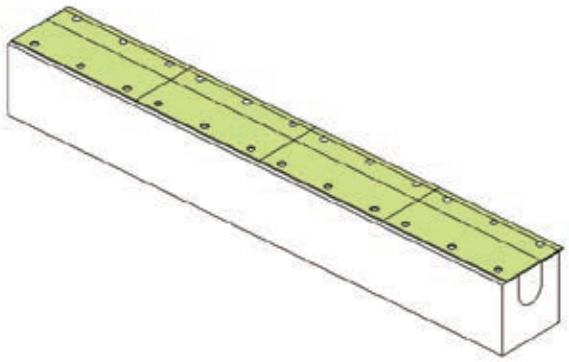


Figure 17.2.1 – 3D View of Gratings

17.2.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Grating marks (or locational references).
2. Materials, qualities, construction, surface finishes of gratings and support channels.
3. Cross-sectional sizes and typical lengths of gratings. Sizes of slots/holes and spacings.
4. Cross-sectional sizes of support channels.
5. Straight/curved.

17.2.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of gratings and frames, create a schedule with the following fields:

<Channel Cover Schedule>

A	B	C	D	E	F
Family	Type	Description	Location	Mark	Length
MW_-GRA-PQS-GMS_Sur.Cha-00	200 Width	500m L x 75mm thk matching cover with 5mm thk SS supporting frame	G/F ST-2	EF-1	3.39 m
MW_-GRA-PQS-GMS_Sur.Cha-00	200 Width	500m L x 75mm thk matching cover with 5mm thk SS supporting frame	G/F ST-4	EF-1	8.20 m
MW_-GRA-PQS-GMS_Sur.Cha-00	200 Width	500m L x 75mm thk matching cover with 5mm thk SS supporting frame	G/F ST-4	EF-1	1.60 m
MW_-GRA-PQS-GMS_Sur.Cha-00	200 Width	500m L x 75mm thk matching cover with 5mm thk SS supporting frame	G/F admission lobby	EF-1	3.40 m
MW_-GRA-PQS-GMS_Sur.Cha-00	200 Width	500m L x 75mm thk matching cover with 5mm thk SS supporting frame	G/F admission lobby	EF-1	1.23 m
MW_-GRA-PQS-GMS_Sur.Cha-00	200 Width	500m L x 75mm thk matching cover with 5mm thk SS supporting frame	ST-2 landing +13.00	EF-1	1.94 m
MW_-GRA-PQS-GMS_Sur.Cha-00	200 Width	500m L x 75mm thk matching cover with 5mm thk SS supporting frame	ST-2 landng +7.80	EF-1	2.00 m
MW_-GRA-PQS-GMS_Sur.Cha-00	200 Width	500m L x 75mm thk matching cover with 5mm thk SS supporting frame	G/F ST-3	EF-1	2.12 m
MW_-GRA-PQS-GMS_Sur.Cha-00	200 Width	500m L x 75mm thk matching cover with 5mm thk SS supporting frame	G/F ST-3	EF-1	1.64 m
Grand total: 9					25.54 m

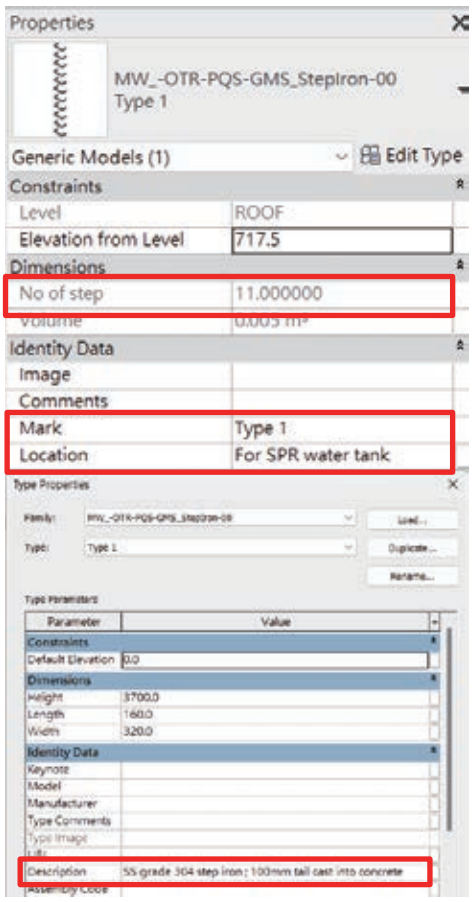
Adjust for the following as necessary:

- Nil.

17.3 STEP IRONS

17.3.1 BASIC MODELLING APPROACHES

Based on the generic model templates, create a loadable family type for each type and size of step irons, and place the individual object in the designed location.



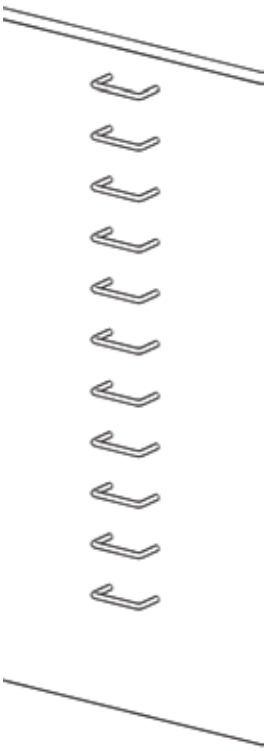


Figure 17.3.1 – 3D View of Step Irons

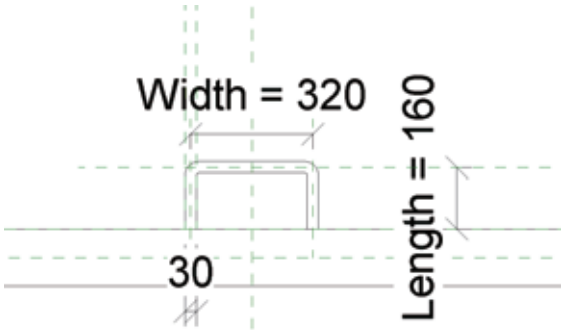

Figure 17.3.2 – Plan View of Step Iron

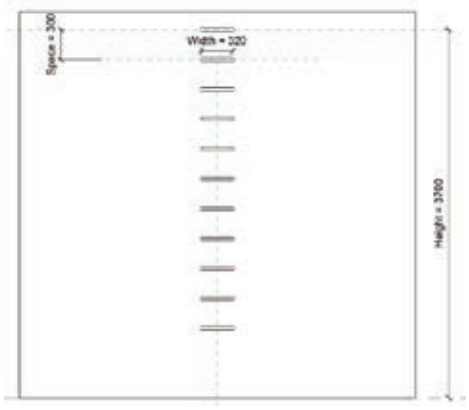

Figure 17.3.3 – Front Elevation of Step Irons

17.3.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Step iron marks (or locational references).
2. Materials, qualities, construction, surface finishes and fixing methods.
3. Overall sizes and thicknesses.

17.3.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of step irons, create a schedule with the following fields:

<Step Iron Schedule>

A	B	C	D	E	F	G
Family	Type	Description	Level	Count	Location	No of step
MW_-OTR-PQS-GMS_StepIron-00	Type 1	SS grade 304 step iron ; 100mm tail cast into concrete	ROOF	1	For SPR water tank	11
MW_-OTR-PQS-GMS_StepIron-00	Type 1	SS grade 304 step iron ; 100mm tail cast into concrete	ROOF	1	For FS water tank	11
Grand total: 2				2		22

Note:

- Step irons are only measured independently where they are not specified and included as part of another object of other section, e.g., manhole.
- With sufficient reference marks and location reference, the number of step irons in individual locations can be extracted; or designers/modellers provide a schedule on the same.

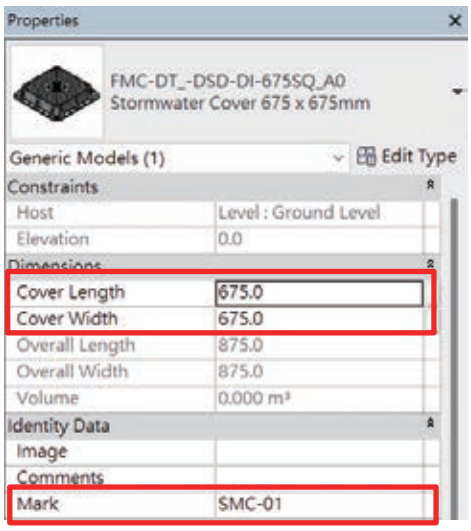
Adjust for the following as necessary:

- Nil.

17.4 MANHOLE COVERS AND FRAMES

17.4.1 BASIC MODELLING APPROACHES

Based on the generic model templates, create a loadable family type for each type and size of manhole covers, and place the individual object in the designed location.



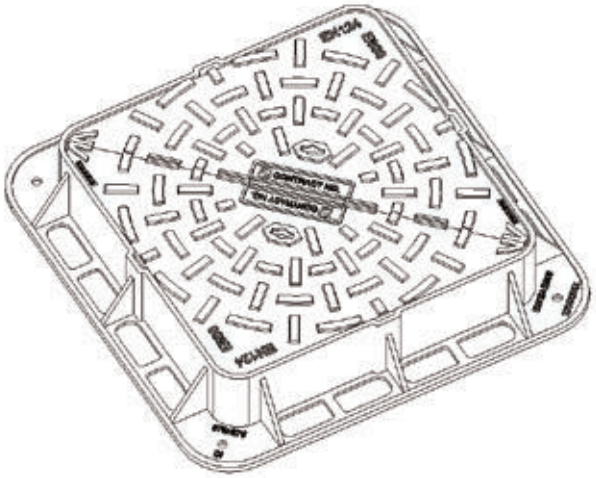


Figure 17.4.1 – 3D View of Manhole Cover

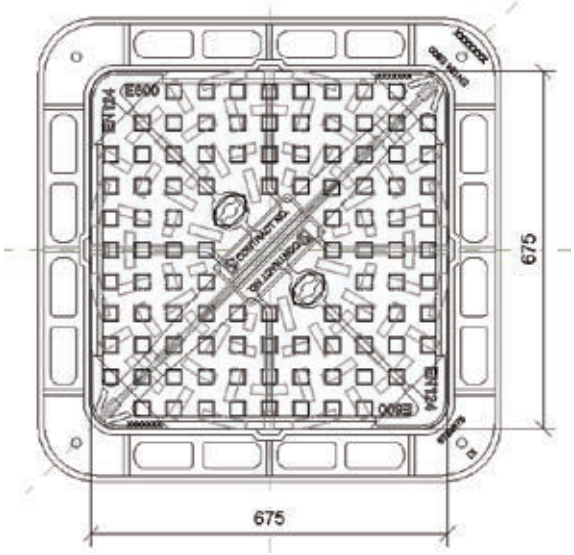


17.4.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Manhole cover marks (or locational references).
2. Manhole cover types: light duty/medium duty/heavy duty/single seal/double seal/recessed pattern/finished to match surrounding.
3. Materials, qualities, construction, surface finishes of manhole covers and frames.
4. Clear opening sizes.

17.4.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of manhole covers, create a schedule with the following fields:

<Manhole Cover Schedule>

A	B	C	D	E	F
Family	Type	Cover Length	Cover Width	Mark	Count
FMC-DT_-DSD-DI-675SQ_A0	Stormwater Cover 675 x 675mm	675	675	SMC-01	1

Note:

- Manhole covers and frames are only measured independently where they are not specified and included as part of another object of other section, e.g., manhole.

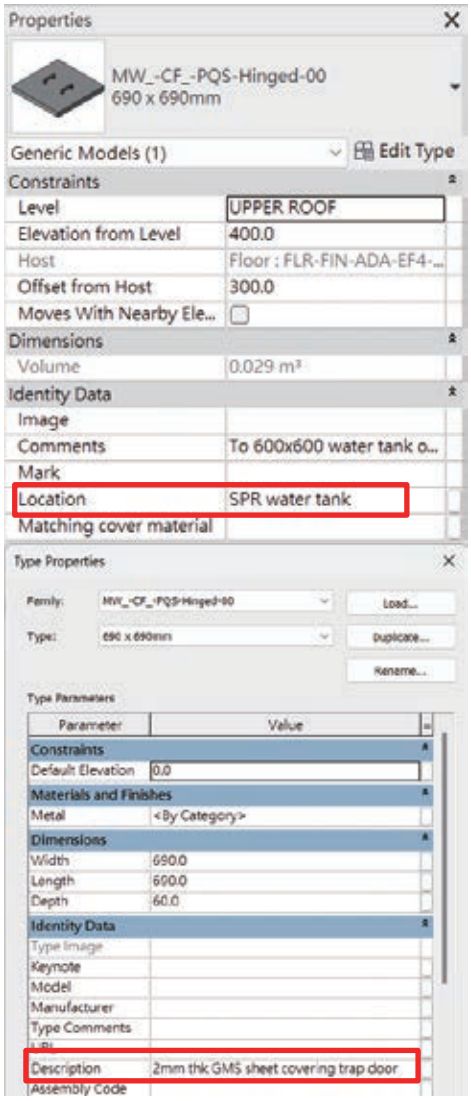
Adjust for the following as necessary:

- Nil.

17.5 HINGED COVERS AND FRAMES

17.5.1 BASIC MODELLING APPROACHES

Based on the generic model templates, create a loadable family type for each type and size of hinged covers, and place the individual object in the designed location.



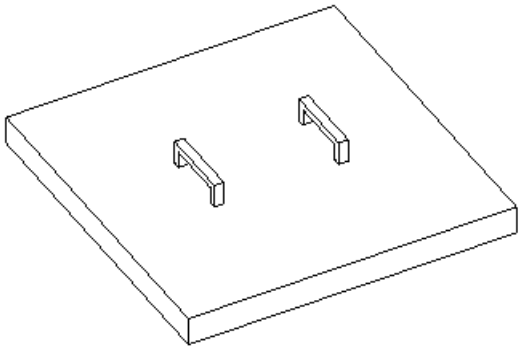


Figure 17.5.1 – 3D View of Hinged Cover

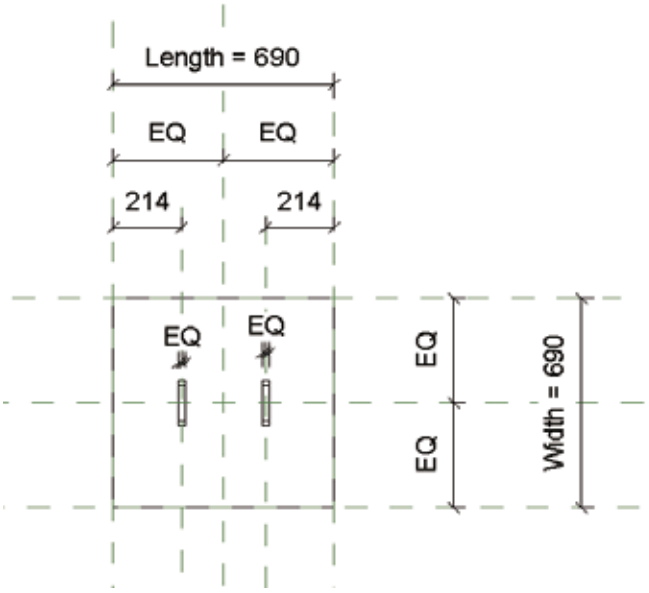

Figure 17.5.2 – Plan View of Hinged Cover

17.5.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Hinged cover marks (or locational references).
2. Materials, qualities, construction and surface finishes of hinged covers and frames.
3. Clear opening sizes.
4. Ironmongery like hinges, lock plates and padlocks (if any).

17.5.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of hinged covers, create a schedule with the following fields:

<Hinged Covers and Frames to Water Tanks Schedule>

A	B	C	D	E
Family	Type	Description	Location	Count
MW_-CF_-PQS-Hinged-00	690 x 690mm	2mm thk GMS sheet covering trap door	SPR water tank	1
MW_-CF_-PQS-Hinged-00	690 x 690mm	2mm thk GMS sheet covering trap door	FS water tank	1
Grand total: 2				2

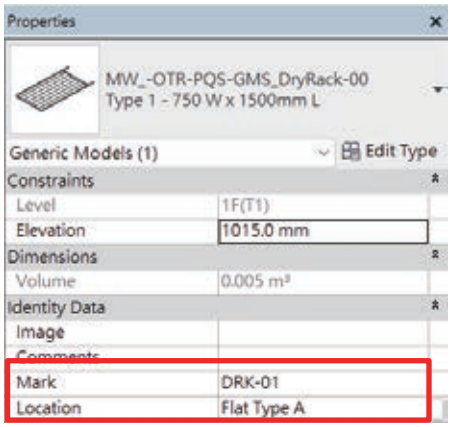
Adjust for the following as necessary:

- Nil.

17.6 DRYING RACKS

17.6.1 BASIC MODELLING APPROACHES

Based on one of the generic model templates, create a loadable family type for each type and size of drying racks, and place the individual object in the designed location.



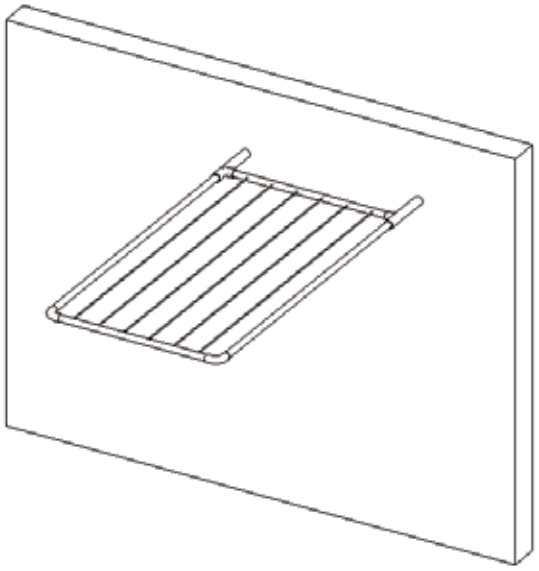


Figure 17.6.1 – 3D View of Drying Rack

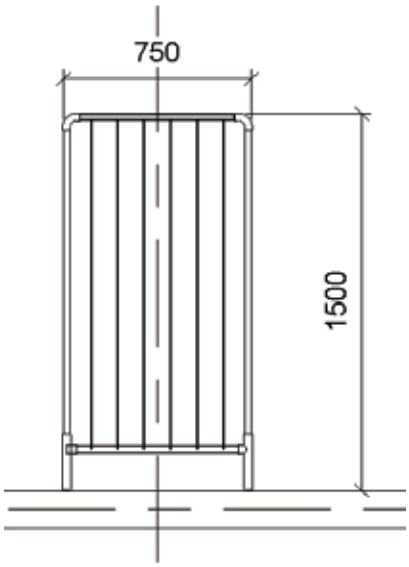

Figure 17.6.2 – Plan View of Drying Rack

17.6.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Drying rack marks.
2. Materials, qualities, construction, surface finishes and fixing methods.
3. Overall sizes.
4. Canvas covers (if any).

17.6.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of drying racks, create a schedule with the following fields:

<Drying Rack Schedule>

A	B	C	D	E
Family	Type	Mark	Location	Count
MW_-OTR-PQS-GMS_DryRack-00	Type 1 - 750 W x 1500mm L	DRK-01	Flat Type A	1

Adjust for the following as necessary:

- Nil.

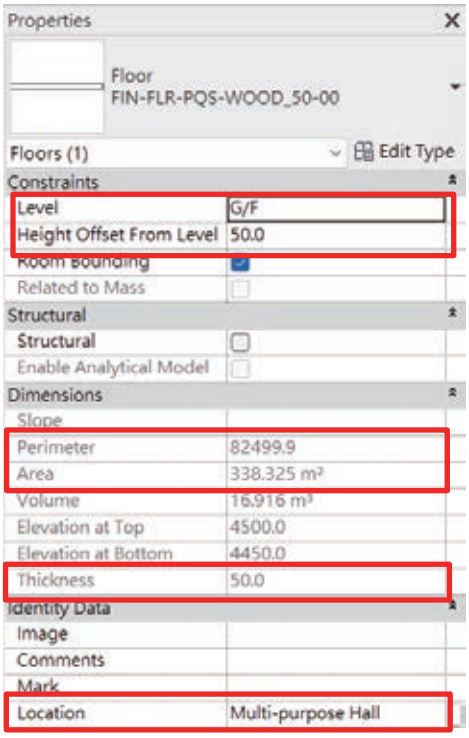
SECTION 18 – JOINERY

18.1 WOOD FLOORING

18.1.1 BASIC MODELLING APPROACHES

Based on the architectural floors template, create a system family type for each type and thickness of wood flooring, place the individual object in the designed location to the required boundary. Set the height offset from base level equal to the overall thickness of floor finishes.

The relevant information that can be extracted from the parameters includes thickness, perimeter, area, etc.



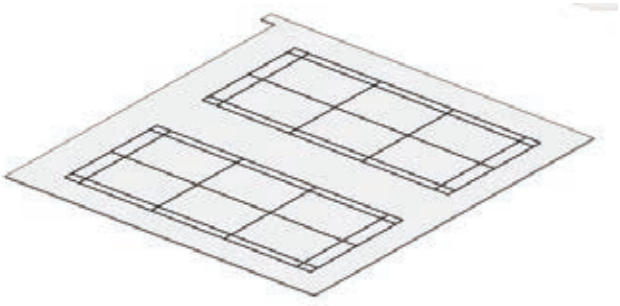


Figure 18.1.1 – 3D View of Wood Flooring

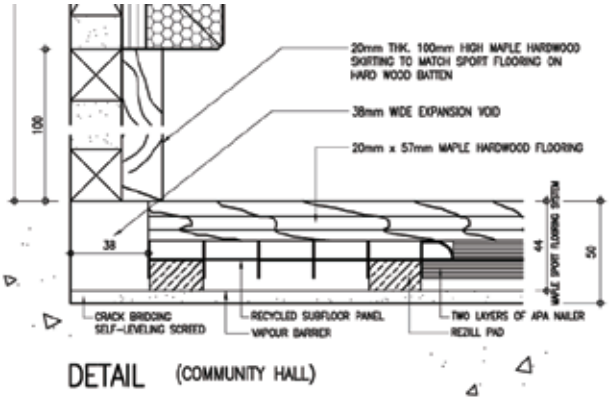

Figure 18.1.2 – Details of Wood Flooring

18.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Flooring marks (or locational references).
2. Materials, qualities, and surface finishes.
3. Typical sizes and thicknesses, pattens and top layers.
4. Moisture resisting membranes, underlays, sub-bases, batten systems or and sub-floor systems.
5. Methods of jointing and bedding materials.

18.1.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of wood floorings, create a schedule with the following fields:

<Wood flooring schedule>

A	B	C	D	E	F	G
Family	Type	Level	Location	Material: Name	Default Thickness	Material: Area
Floor	FIN-FLR-PQS-WOOD_50-00	G/F	Multi-purpose Hall	F1 - Hard wood flooring (double battern with extra underlay) and non-slip coating and line marking on waterproof and self-leveling cement sand screeding	50	338.326 m²
Floor	FIN-FLR-PQS-WOOD_50-00	G/F	Stage	F1 - Hard wood flooring (double battern with extra underlay) and non-slip coating and line marking on waterproof and self-leveling cement sand screeding	50	131.892 m²
Floor	FIN-FLR-PQS-WOOD_50-00	G/F	Stage	F1 - Hard wood flooring (double battern with extra underlay) and non-slip coating and line marking on waterproof and self-leveling cement sand screeding	50	82.880 m²
Floor	FIN-FLR-PQS-WOOD_50-00	G/F	Stage	F1 - Hard wood flooring (double battern with extra underlay) and non-slip coating and line marking on waterproof and self-leveling cement sand screeding	50	5.750 m²
Grand total: 4						558.848 m²

Note:

- According to HKSMM5, wood flooring area is measured based on the net area covered.
- There is an alternative measurement rule of no deduction for voids ≤ 1.00 m^2.

Adjust for the following as necessary:

- Nil.

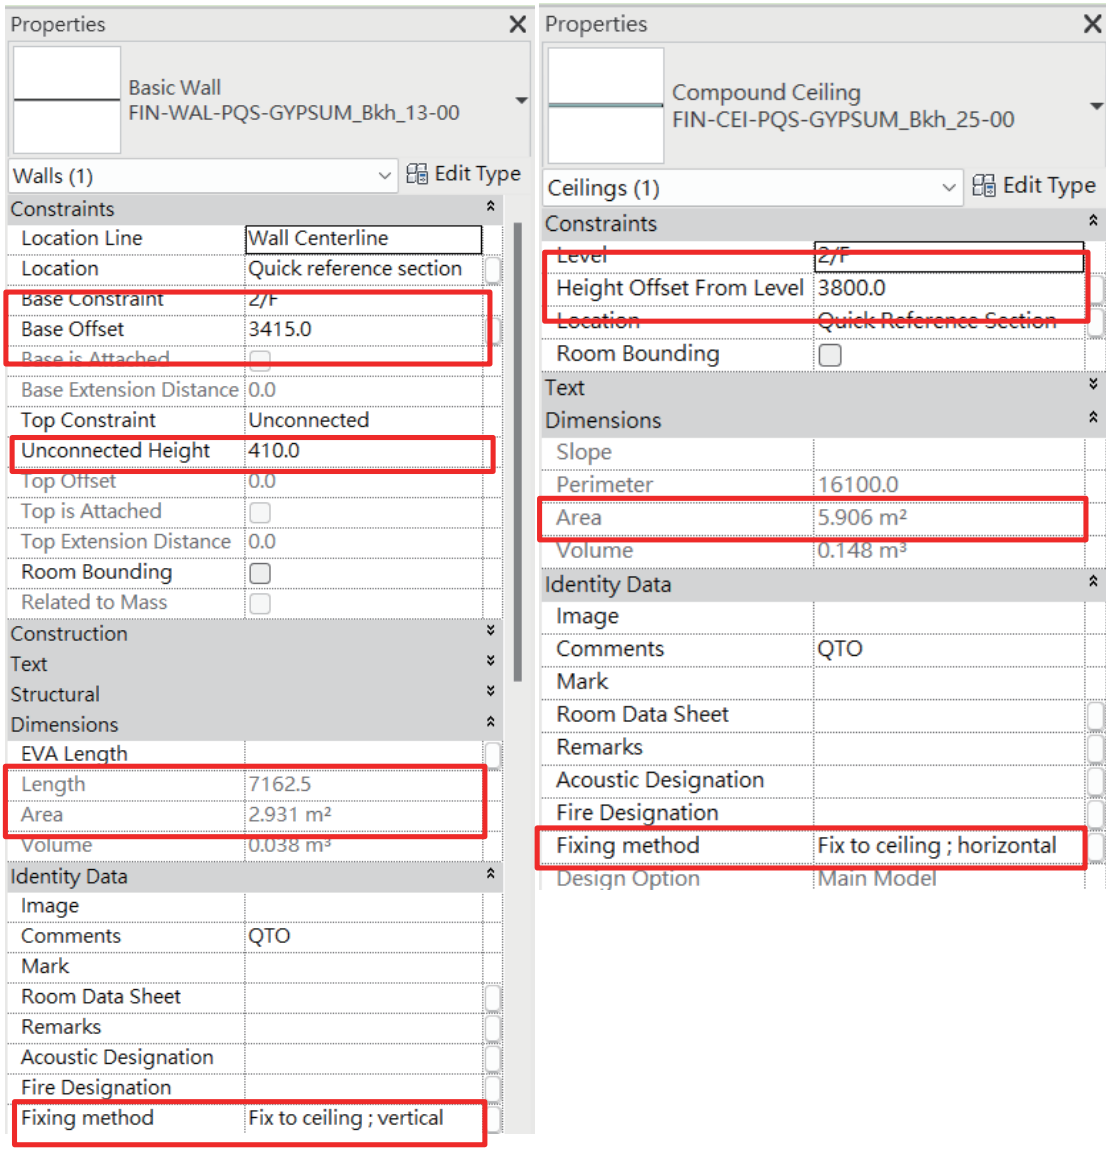
18.2 WOOD FALSE CEILINGS AND BULKHEADS

18.2.1 BASIC MODELLING APPROACHES

Based on the architectural walls template, create a system family type for each type and cross-sectional size of bulkheads to ceilings, and place the individual object in the designed location to the required alignment and length.

Based on the ceilings template, create a system family type for each type and thickness of compound ceilings, and place the individual object in the designed location to the required boundary.

The relevant information that can be extracted from the parameters includes length, unconnected height (bulkhead height), width (bulkhead thickness), area, etc.



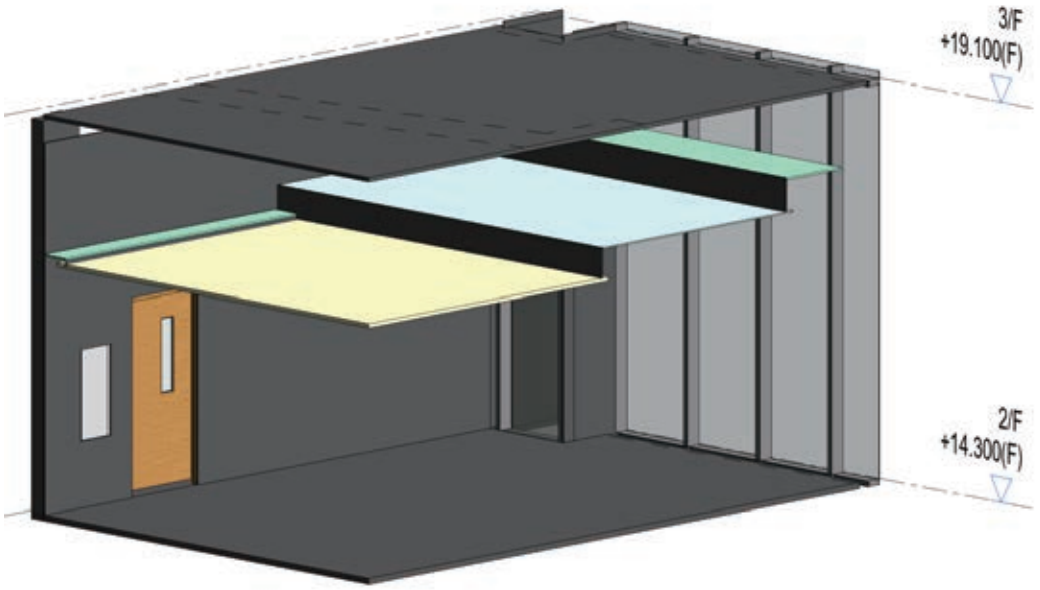


Figure 18.2.1 – 3D View of Bulkheads to ceiling

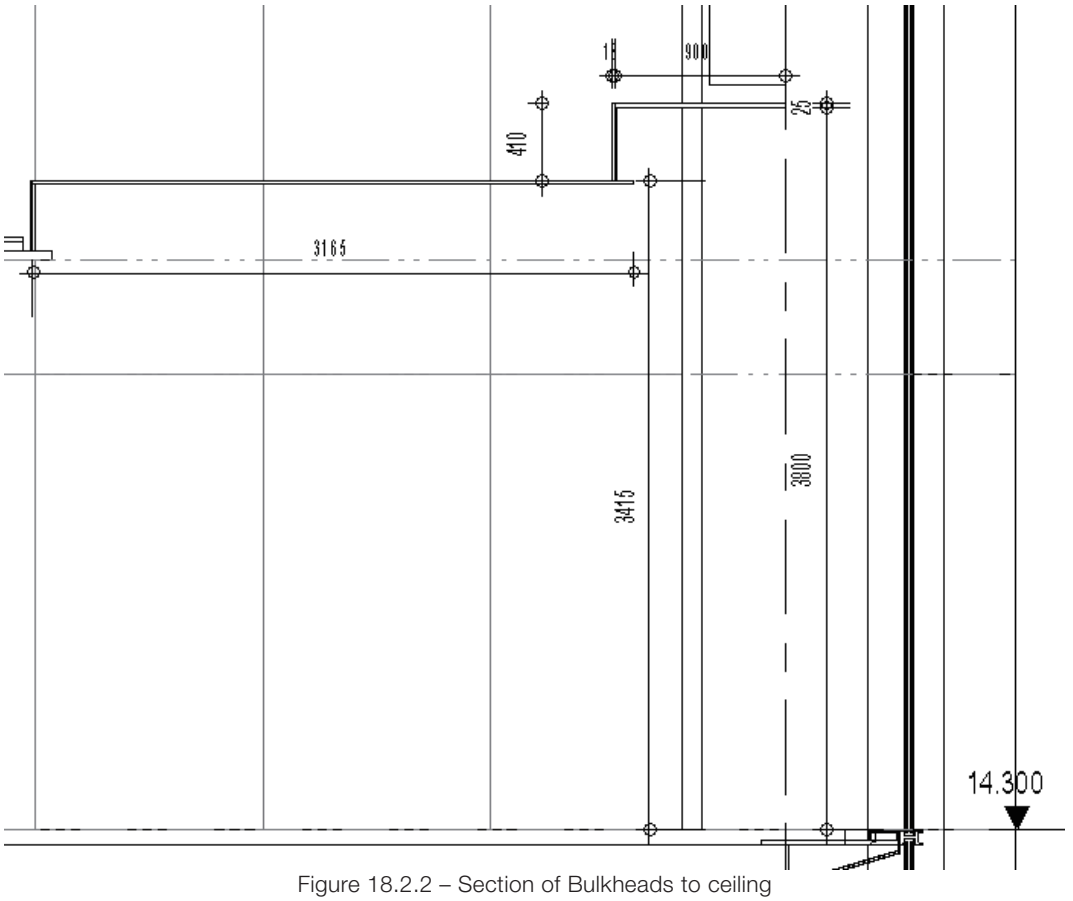

Figure 18.2.2 – Section of Bulkheads to ceiling

18.2.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Location reference (fix to walls and columns, ceilings and sides and soffits of beams, pipe and service ducts or other).
2. Materials, qualities, construction, surface finishes and fixing methods.
3. Thicknesses and typical sizes of facing panels.
4. Sizes and spacings of members of supporting frames.
5. Horizontal/(sloping > 15° from horizontal)/vertical/curved.

18.2.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of bulkheads, create wall and ceiling schedules with the following fields:

<Bulkhead Schedule - vertical>

A	B	C	D	E	F	G
Family	Type	Base Constraint	Fixing method	Length	Unconnected Height	Area
Basic Wall	FIN-WAL-PQS-GYPSUM_Bkh_13-00	2/F	Fix to ceiling ; vertical	7.162	410	2.93
Basic Wall	FIN-WAL-PQS-GYPSUM_Bkh_13-00	2/F	Fix to ceiling ; vertical	7.162	365	2.61
Basic Wall	FIN-WAL-PQS-GYPSUM_Bkh_13-00	2/F	Fix to ceiling ; vertical	10.912	50	0.55
Grand total: 3						6.09

<Bulkhead Schedule - horizontal>

A	B	C
Family	Type	Material: Name
Compound Ceiling	FIN-CEI-PQS-GYPSUM_Bkh_25-00	C01 - 4 coats of VOC free + anti-mould emulsion paint with skim coat on sealess perforated gypsum board ceiling
Compound Ceiling	FIN-CEI-PQS-GYPSUM_Bkh_25-00	C01 - 4 coats of VOC free + anti-mould emulsion paint with skim coat on sealess perforated gypsum board ceiling
Compound Ceiling	FIN-CEI-PQS-GYPSUM_Bkh_25-00	C01 - 4 coats of VOC free + anti-mould emulsion paint with skim coat on sealess perforated gypsum board ceiling
Compound Ceiling	FIN-CEI-PQS-GYPSUM_Bkh_25-00	C01 - 4 coats of VOC free + anti-mould emulsion paint with skim coat on sealess perforated gypsum board ceiling
Compound Ceiling	FIN-CEI-PQS-GYPSUM_Bkh_25-00	C01 - 4 coats of VOC free + anti-mould emulsion paint with skim coat on sealess perforated gypsum board ceiling
Compound Ceiling	FIN-CEI-PQS-GYPSUM_Bkh_25-00	C01 - 4 coats of VOC free + anti-mould emulsion paint with skim coat on sealess perforated gypsum board ceiling
Compound Ceiling	FIN-CEI-PQS-GYPSUM_Bkh_25-00	C01 - 4 coats of VOC free + anti-mould emulsion paint with skim coat on sealess perforated gypsum board ceiling
Compound Ceiling	FIN-CEI-PQS-GYPSUM_Bkh_25-00	C01 - 4 coats of VOC free + anti-mould emulsion paint with skim coat on sealess perforated gypsum board ceiling
Grand total: 8		

D	E	F	G	H
Level	Fixing method	Height Offset From Level	Count	Material: Area
2/F	Fix to ceiling ; horizontal	3200	1	4.500
2/F	Fix to ceiling ; horizontal	2650	1	4.107
2/F	Fix to ceiling ; horizontal	2850	1	1.538
2/F	Fix to ceiling ; horizontal	3100	1	27.925
2/F	Fix to ceiling ; horizontal	3800	1	5.906
2/F	Fix to ceiling ; horizontal	3950	1	19.205
2/F	Fix to ceiling ; horizontal	2400	1	4.752
2/F	Fix to ceiling ; horizontal	1800	1	10.566
				78.498

Note:

- According to HKSMM5, wood false ceiling and bulkhead areas are measured based on the net area covered.
- There is an alternative measurement rule of no deduction for voids ≤ 1.00 m^2.

Adjust for the following as necessary:

- Nil.

19.1 FURNITURE

19.1.1 BASIC MODELLING APPROACHES

Based on the furniture template, create a loadable family type for each type and size of furniture, and place the individual object in the designed location.

The relevant information that can be extracted from the parameters includes size, etc.

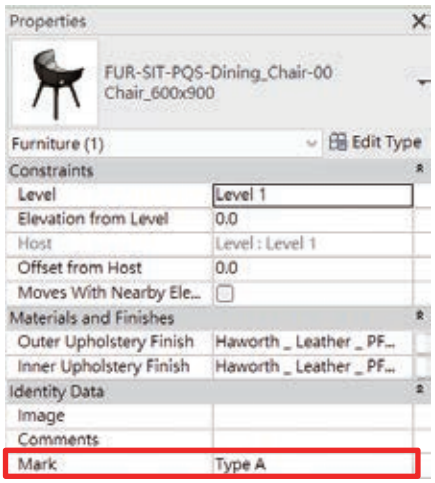

Figure 19.1.1 – 3D View of Fixtures and Furnishings

19.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Furniture marks.
2. Materials, qualities, construction and surface finishes.
3. Overall sizes.
4. Manufacturers' reference marks (if any).

19.1.3 QUANTITY TAKE-OFF GUIDELINES

For the measurement of furniture, create a schedule with the following fields:

<Furniture Schedule>

A	B	C	D
Family	Type	Mark	Count
FUR-SIT-PQS-Dining_Chair-00	Chair_600x900	Type A	1

Adjust for the following as necessary:

- Nil.

SECTION 20 – SURFACE FINISHES

20.1 FLOOR, WALL AND CEILING FINISHES

20.1.1 BASIC MODELLING APPROACHES

(A) Internal Finishes

Internal finishes include plastering, stone, tiling, painting, etc. There can be three modelling approaches for internal finishes as follows:

1) Create Rooms;
2) Apply Paint; or
3) Create separate layers by modelling Floor and Wall as internal finishes layers.

A1 Create Rooms:

Based on the room template, tag each room bounded by room-bounding elements, including walls, columns, floors, roofs, ceilings, curtain systems, etc. Where no room-bounding elements exist, add room separation lines.

When a tagged room is highlighted, the properties pallet will show the room perimeter, area and volume.

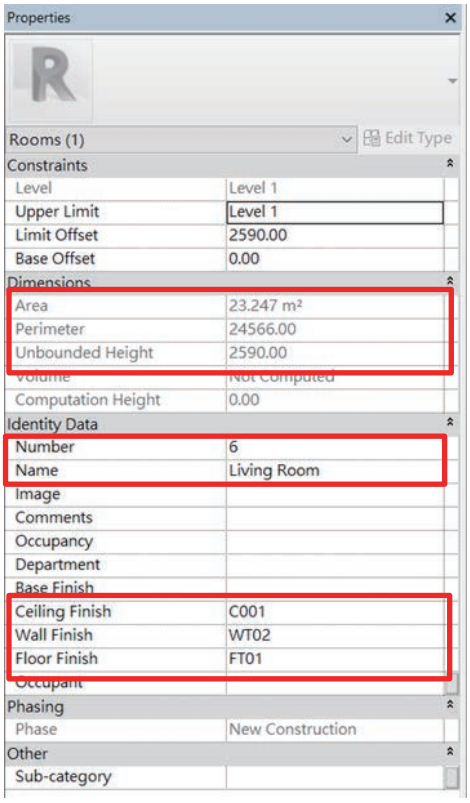

Figure 20.1.1 – Properties of Rooms

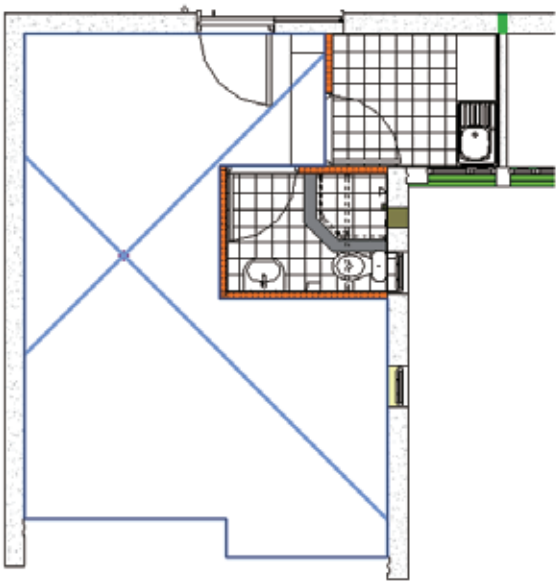

Figure 20.1.2 – Plan View of model (assigned Room)

A2 Apply Paint:

Create a material parameter by applying a Material to the face of an object with the “Paint” function. The whole surface of the selected face of the object or family will be painted. For applying different materials to the same surface, use the “Split” function to divide the surface into different regions. The finishing areas with Paint applied can only be extracted using the material take-off schedule.

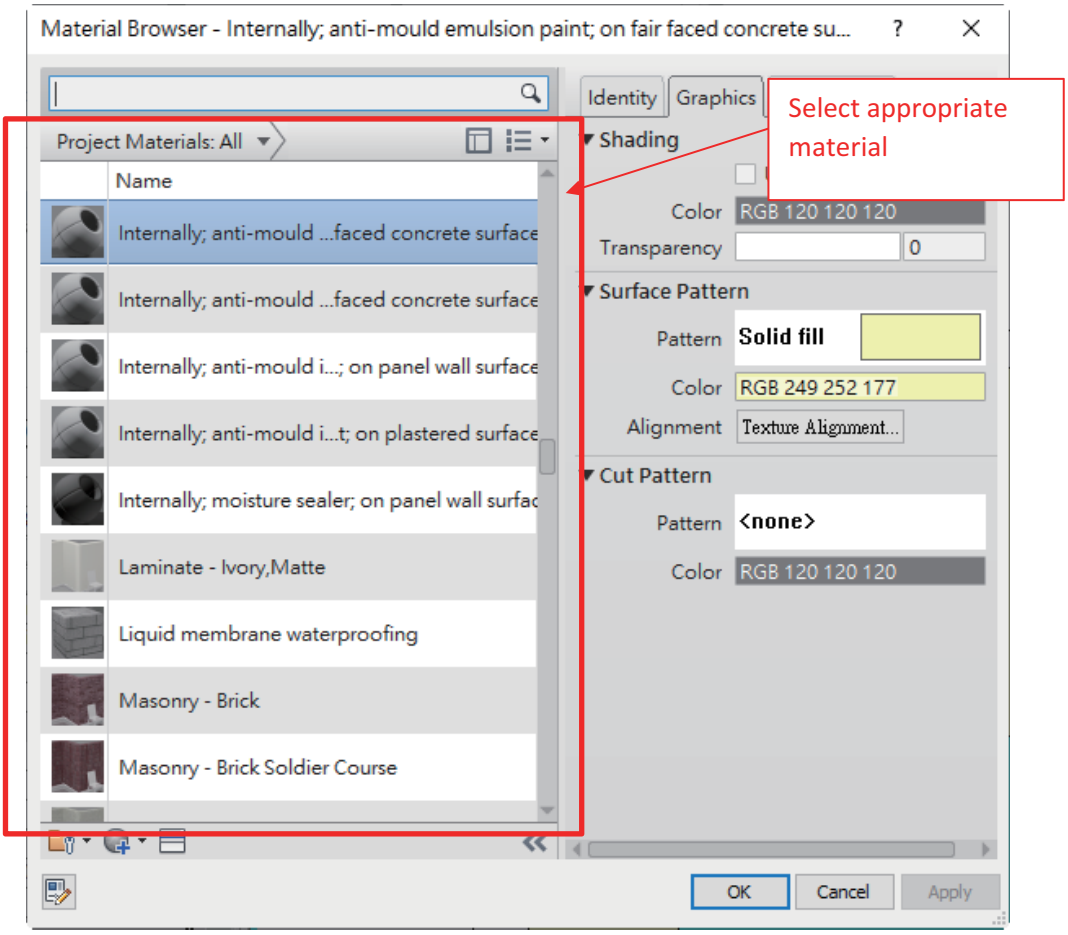

Figure 20.1.3 – Select Material for “Paint”

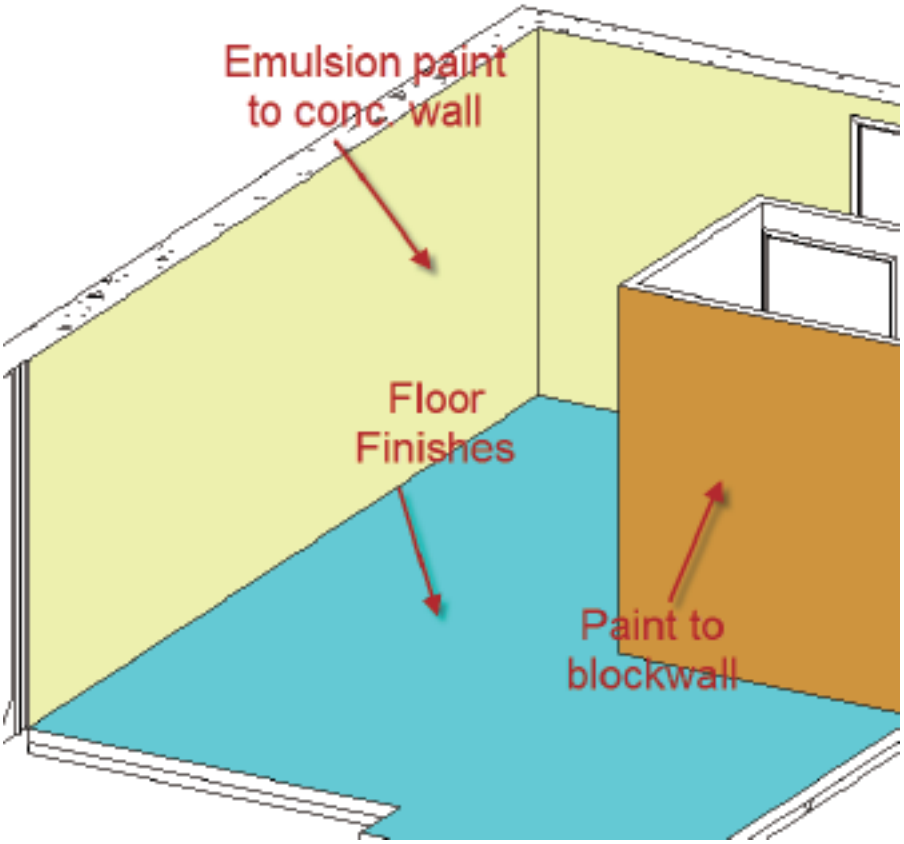

Figure 20.1.4 – 3D View of Finishing Works with Paint Applied

A3 Create separate layers by modelling Floor and Wall as internal finishes layers:
Create an additional layer of floor and/or wall on the designed surfaces to the required boundary to serve as finishes layer.

The relevant information that can be extracted from the parameters includes length, height, perimeter, area, etc.

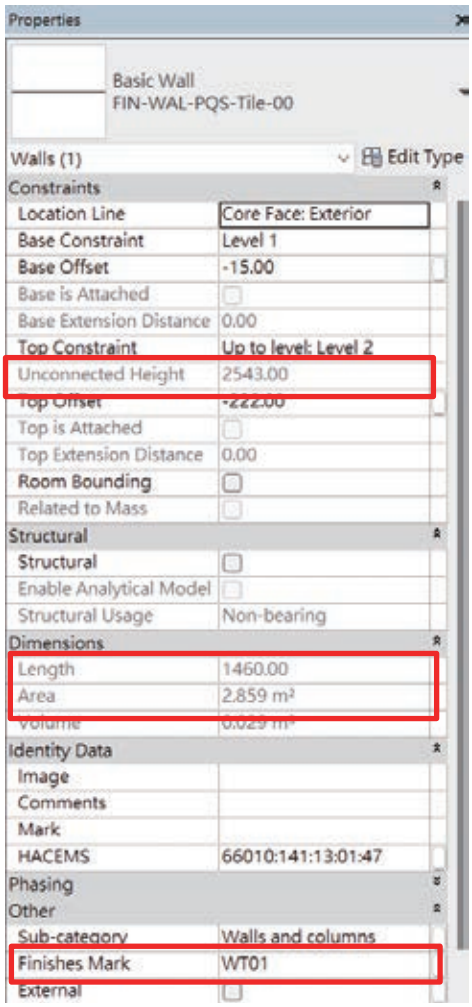

Figure 20.1.5 – Properties of Wall Finishes

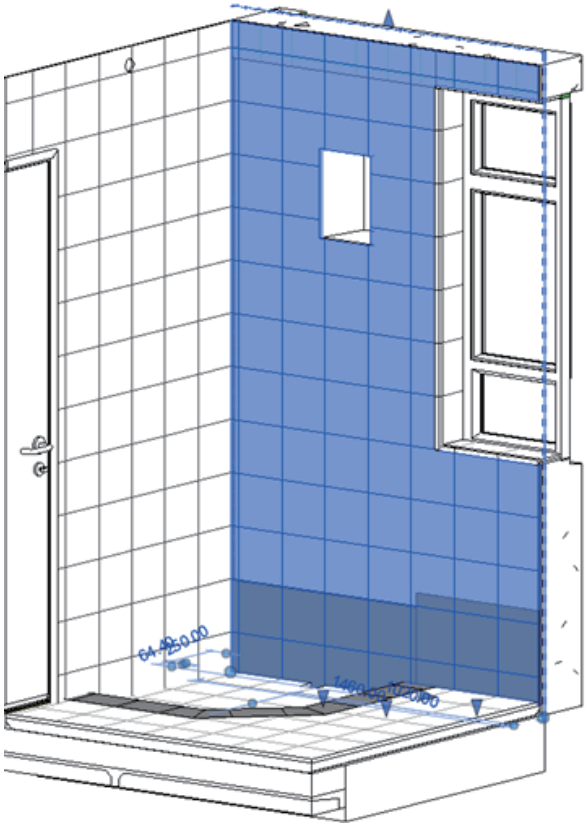

Figure 20.1.6 – 3D View of Bathroom modelled with Wall Finishes

(B) External Finishes

External finishes include plastering, stone, tiling, painting, etc. There can be two modelling approaches for external finishes as follows:

1) Apply Paint; or
2) Create separate layers by modelling Floor and Wall as external finishes layers.

The steps described in 20.1.1(A) above can be followed for these two approaches.

20.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

(A) In-situ finishes (e.g., screeds, granolithic, terrazzo, plaster, mix-applied coatings, excluding those types of finishes stated in (B) & (C) below):

1. Finishes type/mark.
2. Compositions and mixes of materials.
3. Thicknesses, numbers of coats and surface finishes.
4. Works laid in complicated colours and/or patterns.
5. Admixtures including bonding agents, waterproofing agents, air entraining agents and the like.
6. Surface dressings including carborundum grains, stone chippings and the like.
7. Sealers including waterproofers, hardeners, dust-proofers and the like.
8. Whether laid monolithically in one operation with concrete base.
9. Methods of bedding/fixing and supporting frames (if any).
10. Fire resistance ratings/sound reduction ratings (if required).

(B) Tile-like finishes (Stone facing, tiling, rubber/plastic sheet, carpet, etc.):

1. Finishes type/mark.
2. Thicknesses, sizes and shapes of units.
3. Methods of bedding/fixing and jointing.
4. Admixtures including bonding agents, waterproofing agents and the like. (if required)
5. Surface treatments including wax polishing, sealing coats and the like. (if required)
6. Horizontal/sloping (>15o from horizontal)/curved work.
7. Works laid in complicated colours and/or patterns.

(C) Painting:

1. Finishes type/mark.
2. Types and numbers of priming or sealing coats.
3. Types and numbers of undercoats and finishing coats.

20.1.3 QUANTITY TAKE-OFF GUIDELINES

(A) Create Rooms:

For measurement of finishes by Room tags, create schedules with the following fields:

<Room Schedule - Floor finish>

A	B	C
Floor Finish	Name	Area
FT01		
FT01	Living Room	23.25
FT01	Kitchen	3.39
		26.64
FT02		
FT02	Bathroom	2.93
		2.93

Example of Room Schedule for Floor Finishes

<Room Schedule - Wall Finishes>

A	B	C	D	E
Wall Finish	Name	Perimeter	Unbounded Height	Wall Area
WT01				
WT01	Bathroom	6940.00	2590.00	17.97
WT01				17.97
WT02				
WT02	Living Room	24566.00	2590.00	63.63
WT02				63.63
WT03				
WT03	Kitchen	7417.23	2590.00	19.21
WT03				19.21

Example of Room Schedule for Wall Finishes

Set the following formula in the schedule:

- *Wall Area = Perimeter x Unbounded Height*

Note:

- "Area" is for floor and ceiling finishes. It is the overall bounded area without deduction of any void and opening. Deduct voids and openings.
- Add sides of beams with finishes to ceiling areas.
- "Perimeter" is for skirting. Deduct lengths at openings.
- Check that the "Unbounded Height" represents the designed wall finish height, otherwise adjust.
- Deduct wall areas occupied by skirtings.
- Deduct openings, wants and ends of beams within the wall areas lower than the Unbounded Height.
- Adjust areas to sides and soffits of perimeter beams sitting over walls to either wall or ceiling finishes as designed.

(B) Apply Paint:

For measurement of finishes by applying Paint, create a material take-off schedule with the following fields:

<Floor Finishes Material Takeoff>

A	B	C	D
Family	Material: Name	Finishes Mark	Material: Area
Floor	Floor tiling 200x200x7	FT01	3.39
Floor	Floor tiling 200x200x7	FT01	23.25
Grand total: 2			26.64

Example of Material Take-off Schedule for Painting for Floor Finishes

<Wall Finishes Material Takeoff>

A	B	C	D
Family	Material: Name	Finishes Mark	Material: Area
Basic Wall	Wall tiling 200x200x7	WT01	3.59
Basic Wall	Wall tiling 200x200x7	WT01	4.91
Basic Wall	Wall tiling 200x200x7	WT01	2.86
Basic Wall	Wall tiling 200x200x7	WT01	3.01
Grand total: 4			14.37

Example of Material Take-off Schedule for Painting for Wall Finishes

Note:

- The areas should be net of unfinished areas already.

(C) Create separate layers by modelling Floor and Wall as internal/external finishing layers:

For measurement of finishes modelled by Floor and/or Wall, create relevant schedules with the following fields:

<Floor Tile Schedule>

A	B	C	D
Family	Type	Finishes Mark	Area
FIN-FLR-PQS-Tile-00			
Floor	FIN-FLR-PQS-Tile-00	FT01	3.39
Floor	FIN-FLR-PQS-Tile-00	FT01	23.25
Grand total: 2			26.64

Example of Floor Tile Schedule

<Wall Tile Schedule>

A	B	C	D	E	F
Family	Type	Finishes Mark	Length	Unconnected Height	Area
Basic Wall	FIN-WAL-PQS-Tile-00	WT01	1460	2462	3.59
Basic Wall	FIN-WAL-PQS-Tile-00	WT01	2000	2462	4.91
Basic Wall	FIN-WAL-PQS-Tile-00	WT01	1460	2543	2.86
Basic Wall	FIN-WAL-PQS-Tile-00	WT01	1980	2462	3.01
Grand total: 4					14.37

Example of Wall Tile Schedule

Set the following formula in the schedule:

- *Wall Area = Perimeter x Unbounded Height*

Note:

- The areas should be net areas of the layers.
- Refer to (A) for any similar issues for necessary adjustments.

Adjust for the following as necessary:

- Doors, windows and beams (for modelling approach adopting Room tags).
- Voids and openings if required.
- Overlaps of skirting and wall areas.
- Steps, curbs and channels.
- Beware that the measurement should be based on the “net area to be covered (i.e., the net background)”, while the models may give the areas along the centre line or the front face.

20.2 ROOF TILE FINISHES

20.2.1 BASIC MODELLING APPROACHES

here can be two modelling approaches for roof tile finishes as follows:

1) Apply Paint; or
2) Create a relevant layer by floor as roof tile finishes.

See Section 20.1.1(A).

Example of roof tile modelled by a separate layer of floor:

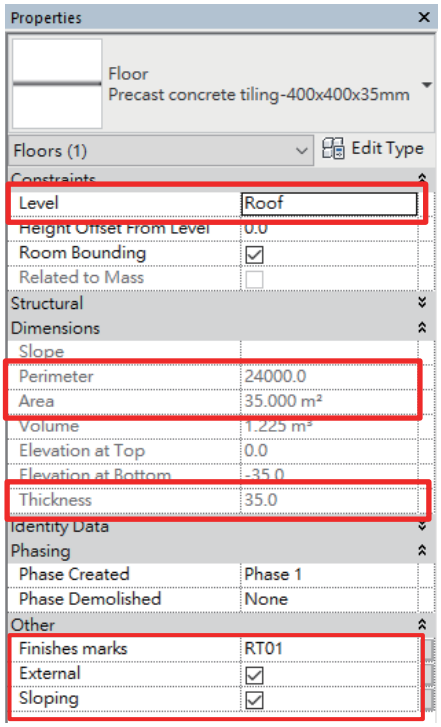

Figure 20.2.1 – Properties of Roof Tile

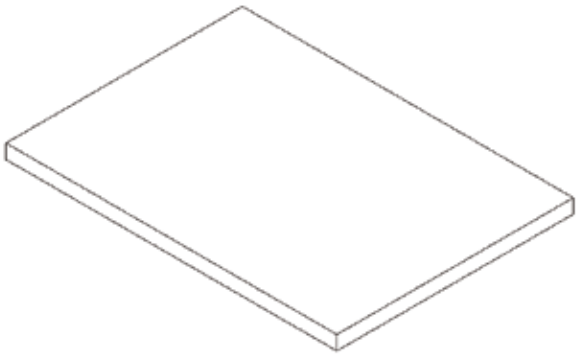

Figure 20.2.2 – 3D View of Roof Tile

20.2.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Finish marks.
2. Types, thicknesses, sizes and shapes of tiles.
3. Method of fixing including any batten systems.
4. Horizontal/sloping (> 15° from horizontal)/vertical/curved.
5. Work laid in complicated colours and/or patterns.

20.2.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of roof tile finishes, create a relevant material take-off schedule depending on the modelling approaches.

(A) Apply Paint:

For measurement of roof tile finishes by applying Paint, create a material take-off schedule with the following fields:

<Roof Tile - Material Takeoff Schedule>

A	B	C	D	E	F
Family	Material: Name	Finishes Marks	Sloping	External	Material: Area
Floor	Precast Concrete Tiles-400x400x35mm	RT01	☑	☑	35.00
Floor	Precast Concrete Tiles-400x400x35mm	RT01	☑	☑	35.00
Grand total: 2					70.00

Example of Roof Tile Material Take-off Schedule (created by "Paint")

(B) Create separate layers by modelling Floor as roof file layers:

For measurement of roof tile finishes modelled by Floor, create a schedule with the following fields:

<Roof Tile Schedule>

A	B	C	D	E	F
Family	Type	Finishes Marks	Sloping	External	Area
Floor	FIN-ROF-PQS-PCTiling-00	RT01	☑	☑	35.00
Floor	FIN-ROF-PQS-PCTiling-00	RT01	☑	☑	35.00
RT01: 2					70.00

Example of Roof Tile Schedule (created by "Floor")

Adjust for the following as necessary:

- Voids and openings if required.
- Beware that the measurement should be based on the "net area to be covered (i.e., the net background)".

20.3 TACTILE

20.3.1 BASIC MODELLING APPROACHES

Based on the generic model templates, create a loadable family type for each type and size of tactile, and place the individual object in the designed location.

Create shared parameters “Tactile Length” and “Tactile Width”, otherwise only volume is given.

The relevant information that can be extracted from the parameters includes tactile type, size, etc.

Another option for modelling tactile is to create a separate layer by Floor. Refer to Section 20.1.1(A).

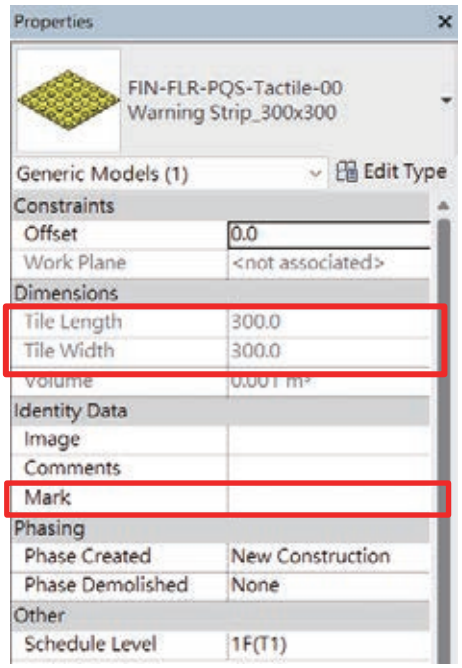

Figure 20.3.1 – Properties and Type Properties of Tactile

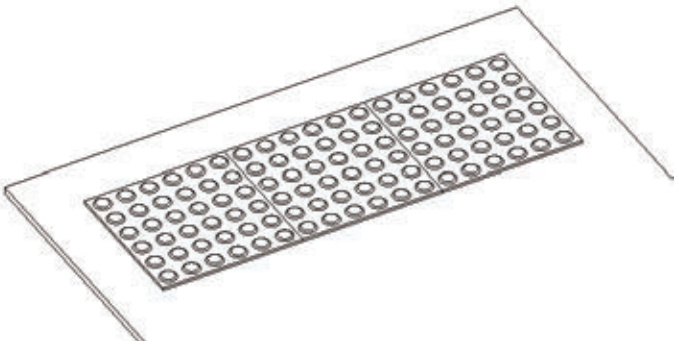

Figure 20.3.2 – 3D View of Tactile

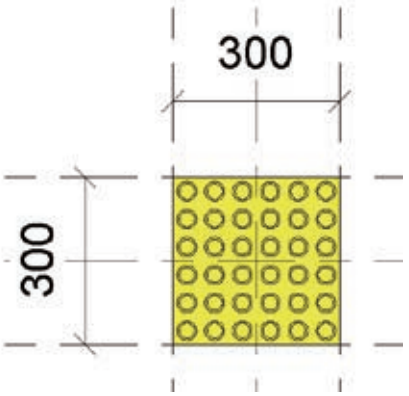

Figure 20.3.3 – Plan View of Tactile

20.3.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Tactile marks.
2. Tactile types: warning (or stop)/direction (or go)/turning (or positional).
3. Materials, qualities, surface finishes and fixing methods.
4. Sizes.

20.3.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of tactiles, create a schedule with the following fields:

<Tactile Schedule>

A	B	C	D	E	F
Family	Type	Count	Tile Length	Tile Width	Tile Area
FIN-FLR-PQS-Tactile-00	Warning Strip_300x300	1	300	300	0.09
FIN-FLR-PQS-Tactile-00	Warning Strip_300x300	1	300	300	0.09
FIN-FLR-PQS-Tactile-00	Warning Strip_300x300	1	300	300	0.09
Grand total: 3		3			0.27

Set the following formula in the schedule:

- *Tile Area = Tile Length * Tile Width*

Adjust for the following as necessary:

- Nil.

SECTION 21 – PAINTING

21.1 PAINTING

21.1.1 BASIC MODELLING APPROACHES

The model information requirements for painting are similar to those for other types of finishes. Similarly, the approach to extracting quantities of painting is the same as that for finishes.

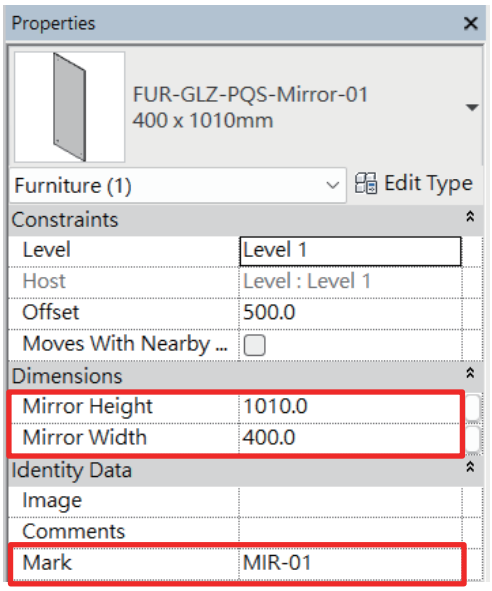
The basic modelling approaches, the information requirements for quantity take-off, and the quantity take-off guidelines are not repeated here.

22.1 MIRRORS

22.1.1 BASIC MODELLING APPROACHES

Based on the furniture template, create a loadable family type for each type and size of mirrors, and place the individual object in the designed location.

The relevant information that can be extracted from the parameters includes width, height, etc.



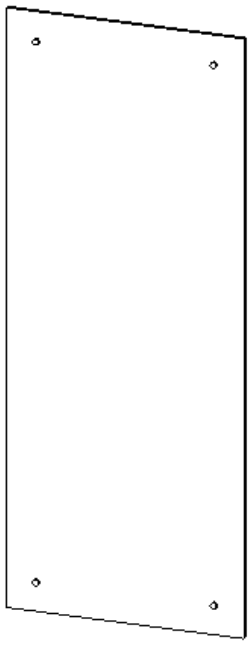


Figure 22.1.1 – 3D View of Mirror

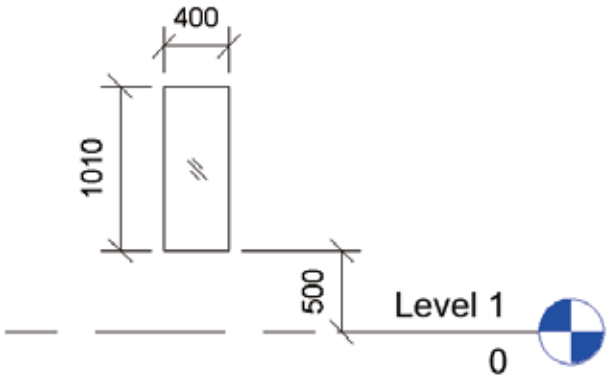

Figure 22.1.2 – Front Elevation of Mirror

22.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Mirror marks (or locational references).
2. Type, quality, overall sizes of mirrors. Thicknesses of glass.
3. Any bevelled edges, backings and edge frames.
4. Framing support details.

22.1.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of mirrors, create a schedule with the following fields:

<Mirror Schedule>

A	B	C	D	E	F
Family	Type	Mark	Mirror Width	Mirror Height	Count
FUR-GLZ-PQS-Mirror-01	400 x 1010mm	MIR-01	400	1010	1

Adjust for the following as necessary:

- Nil.

SECTION 23 – DRAINAGE BELOW GROUND

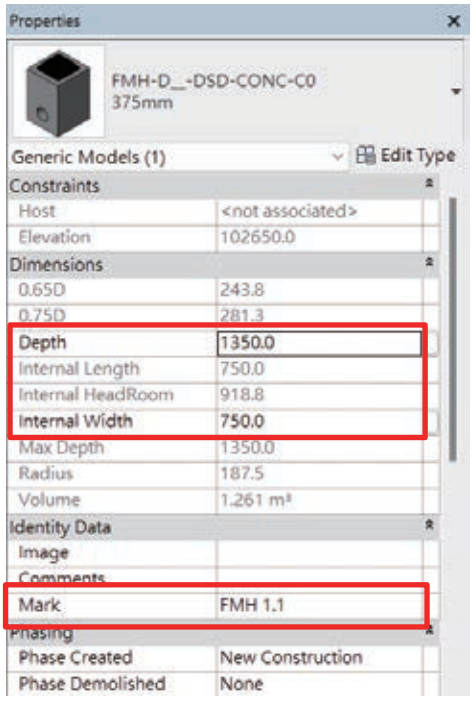
23.1 MANHOLES

23.1.1 BASIC MODELLING APPROACHES

Based on the generic model templates, create a loadable family type for each type and size of manholes, and place the individual object in the designed location.

Adopt parametric modelling such that the model geometry will be changed accordingly when the dimensional values are modified. This can avoid inconsistency between geometrical and non-geometrical information.

The relevant information that can be extracted from the parameters includes system type, manhole type, cover level, invert level, internal length/width, depth to invert, etc.



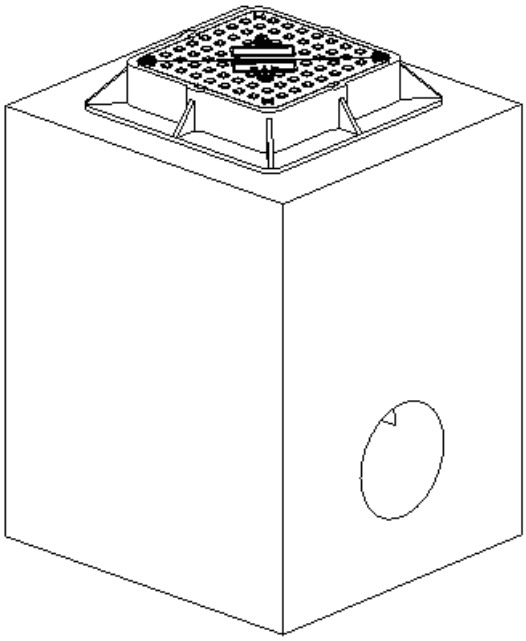


Figure 23.1.1 – 3D View of Manhole

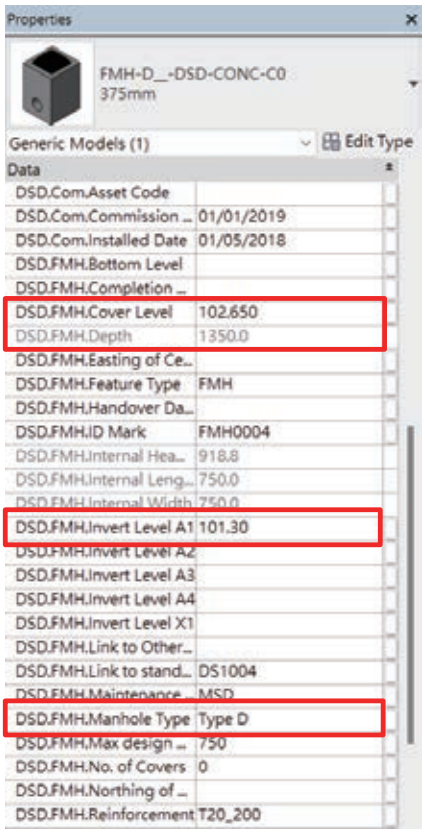

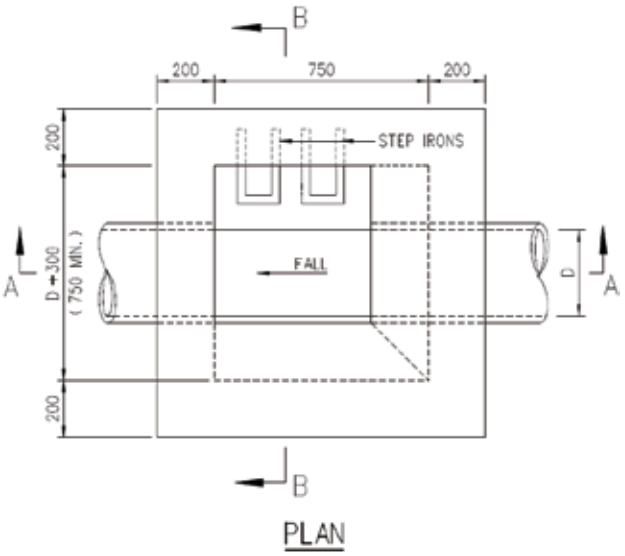

Figure 23.1.2 – DSD Standard Drawing DS 1004C

Note: D is the diameter of pipe.
For this example, D = 375mm.

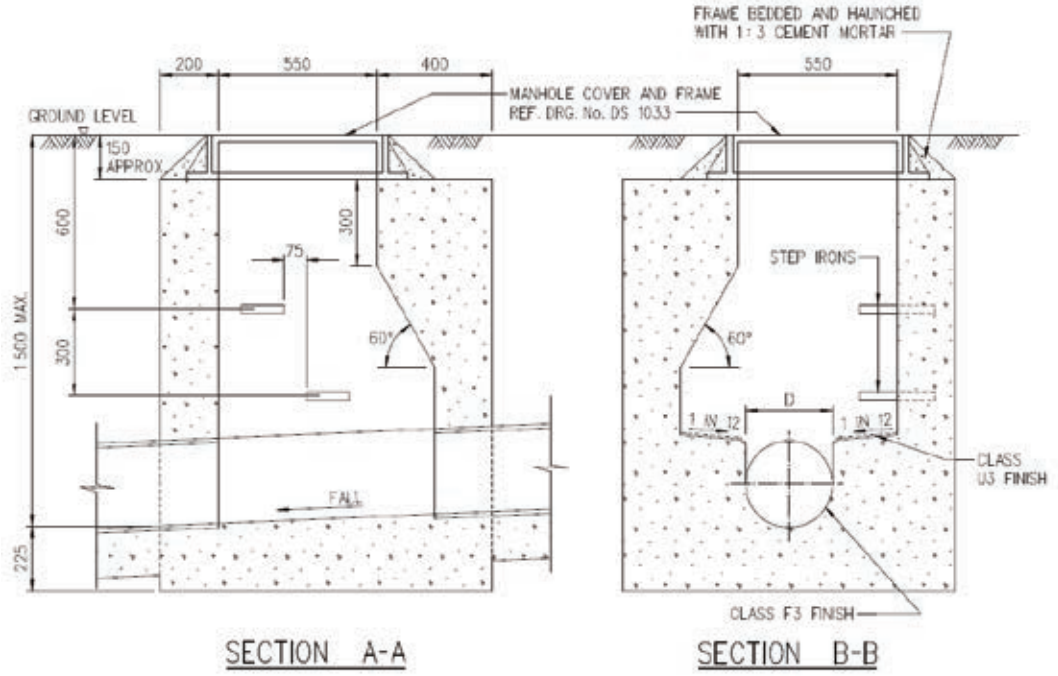

Figure 23.1.3 – Section

23.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Manhole marks.
2. System types.
3. Manhole types.
4. Construction details of base slabs, walls and cover slabs.
5. Internal finishes.
6. Internal sizes.
7. Cover levels.
8. Invert levels of manholes.
9. Sizes of main and branch channels.
10. Manhole covers and frames
11. Accessories like backdrops, step irons, access ladders, etc. (if any)

23.1.3 QUANTITY TAKE-OFF GUIDELINES

For the measurement of manholes, create a schedule with the following fields:

<Manhole Schedule>

A	B	C	D	E	F	G
Family	Type	DSD.FMH.Manhole	Mark	DSD.FMH.Internal Length	DSD.FMH.Internal Width	DSD.FMH.Cover Level
FMH-D__-DSD-CONC-C0	375mm	Type D	FMH 1.1	750	750	102.650
FMH-D__-DSD-CONC-C0	375mm	Type D	FMH 1.2	750	750	102.650
FMH-D__-DSD-CONC-C0	375mm	Type D	FMH 1.3	750	750	102.650
FMH-D__-DSD-CONC-C0	375mm	Type D	FMH 1.4	750	750	102.650

H	I	J
DSD.FMH.Invert Level	DSD.FMH.Depth	Count
101.30	1350	1
101.22	1430	1
101.18	1470	1
101.11	1500	1

Measurement of similar items such as drain pits, gullies, sump pits, grease traps, and petrol interceptor can be done by creating similar schedules.

Note:

- According to HKSMM5, manholes are to be classified by depth ≤ 1.00 m, and thereafter in 0.50 m stages. The depth is measured between the cover level and the invert level.

Adjust for the following as necessary:

- Nil.

23.2 DRAIN PIPES

23.2.1 BASIC MODELLING APPROACHES

Based on the pipes template, create a system family type for each type of drain pipes with routing preferences set for different diameters and fittings, and place the individual object in the designed location to the required alignment and length.

The relevant information that can be extracted from the parameters includes system type, pipe type, size, length, etc.

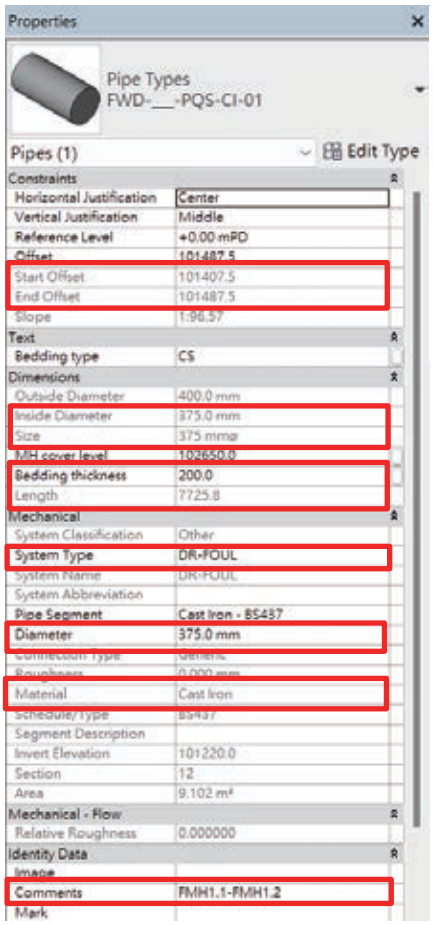

Figure 23.2.1 – 3D View of Drain Pipe

Start and End Offset should align with the manholes schedule.

However, Revit defaults the pipe level (the vertical justification) at the centre line of the pipe, while the invert level is the level of the internal bottom of a pipe. Therefore, half of the internal diameter should be deducted from the default pipe level to give the invert level. For the above example, the start level of FMH1.1 (i.e., the start end) at 101407.5 should minus half of the internal pipe diameter of 187.5 (= 375/2) to give the adjusted start invert level of 101220. For the other end at FMH1.2, the adjusted end invert level is 101300.

23.2.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. System types.
2. Pipe types: cast iron/vitrified clay/precast concrete/ductile iron/polyvinyl chloride/concrete porous/unglazed clayware/perforated plastic/other pipes.
3. Bedding type: bed/bed and haunch/bed and surround (for pipes in soil only).
4. Wrappings or linings to pipes (if any).
5. Painting to pipe (not for pipes in soil).
6. Pipe accessories.
7. Connecting to which manholes.
8. Methods of jointing.
9. Nominal diameters of drain pipes.
10. Bedding dimensions.
11. Commencement levels for drain pipe excavation (for pipes in soil only).
12. Invert levels of drain pipes at both ends.

23.2.3 QUANTITY TAKE-OFF GUIDELINES

For the measurement of drain pipes, create a schedule with the following fields:

<Pipe Schedule>

A	B	C	D	E	F	G	H
Comments	Type	System Type	Material	Size	Bedding type	Bedding thickness	Length
FMH1.1-FMH1.2	FWD-___-PQS-CI-01	DR-FOUL	Cast Iron	375 mmø	CS	200	7726
FMH1.2-FMH1.3	FWD-___-PQS-CI-01	DR-FOUL	Cast Iron	375 mmø	CS	200	4380
FMH1.3-FMH1.4	FWD-___-PQS-CI-01	DR-FOUL	Cast Iron	375 mmø	CS	200	6900

Note:

- According to HKSMM5, pipes are measured along the centre lines of pipes over all bends, junctions and other pipe fittings, which are not separately measured.
- There is an alternative rule that all pipe fittings are enumerated, and pipes are still measured along the centre lines of pipes but not through pipe fittings.
- There is another alternative rule in HKSMM5 that drain pipes laid to or fixed to different backgrounds are not measured separately, but are grouped together.
- The alternative rules apply only if expressly so stated.

Adjust for the following as necessary:

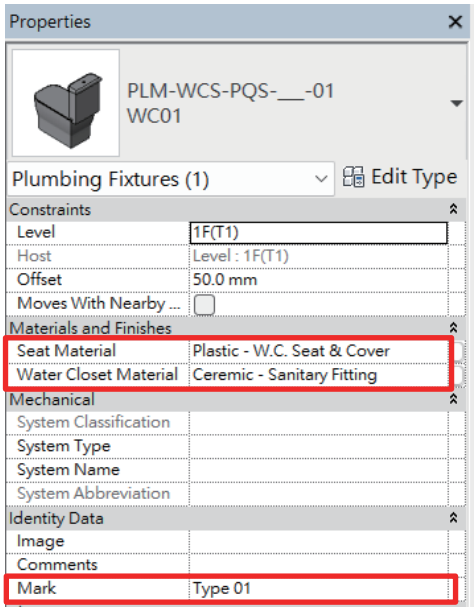
- According to HKSMM5, the length of pipes entering manholes are measured to the inside surfaces of manholes. A special preamble is required for measuring drain pipes up to the external walls of manholes if this is the modelling practice of the project.

SECTION 24 – WATER SUPPLY SYSTEMS AND DISPOSAL SYSTEMS

24.1 SANITARY FITTINGS AND ANCILLARIES

24.1.1 BASIC MODELLING APPROACHES

Based on the plumbing fixtures template, create a loadable family type for each type and size of sanitary fittings, and place the individual object in the designed location.



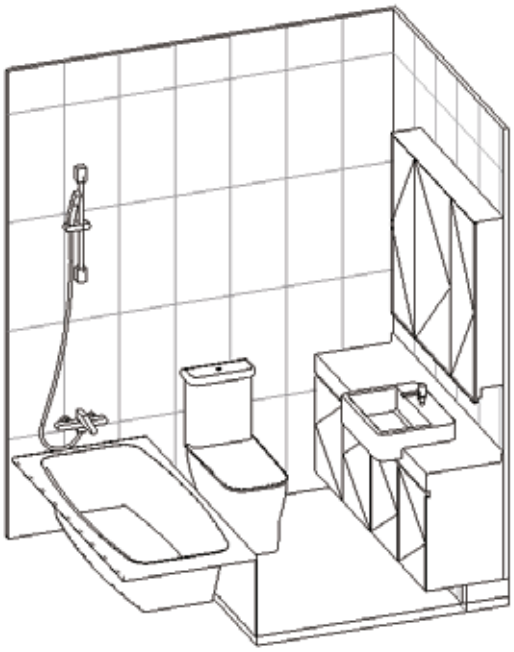


Figure 24.1.1 – 3D View of Sanitary Fittings

24.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Sanitary fitting marks.
2. Types, materials, sizes, surface finishes and capacities.
3. Specification references.

24.1.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of sanitary fittings, create a schedule with the following fields:

<Sanitary Fittings Schedule>

A	B	C	D
Family	Type	Mark	Count
PLM-TUB-PQS-___-01	BT_Type A	Type A	1
PLM-SHR-PQS-___-03	SM03	Type 03	1
PLM-WCS-PQS-___-01	WC01	Type 01	1

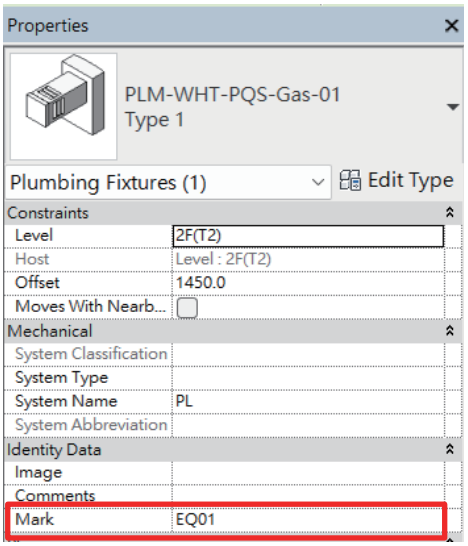
Adjust for the following as necessary:

- Nil.

24.2 EQUIPMENT

24.2.1 BASIC MODELLING APPROACHES

Based on the plumbing fixtures template, create a loadable family type for each type and size of equipment, and place the individual object in the designed location.



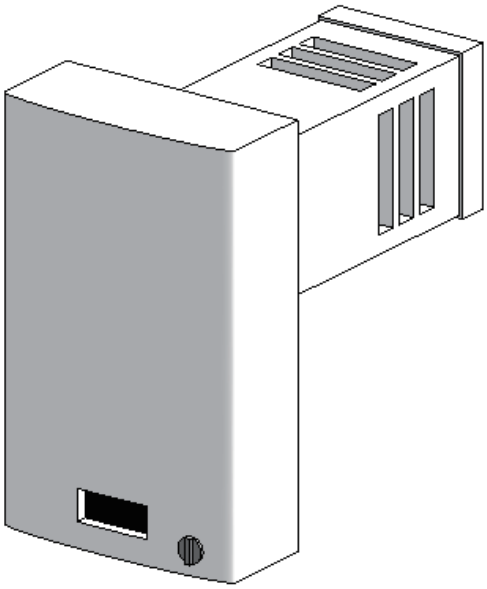


Figure 24.2.1 – 3D View of Gas Water Heater

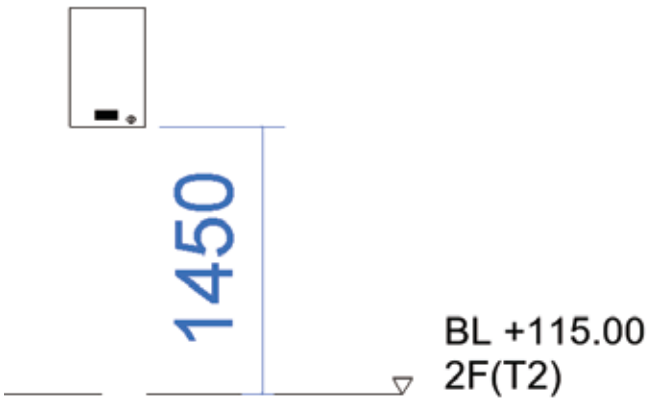

Figure 24.2.2 – Front Elevation of Gas Water Heater

24.2.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. Equipment marks.
2. Types, sizes, surface finishes and capacities of equipment.
3. Specification references.
4. Fixing methods including any backings and supports.
5. Thermal insulations to equipment (if any).
6. Sound insulations to equipment (if any).

24.2.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of equipment, create a schedule with the following fields:

<Equipment Schedule>

A	B	C	D
Family	Type	Mark	Count
PLM-WHT-PQS-Gas-01	Type 1	EQ01	1

Adjust for the following as necessary:

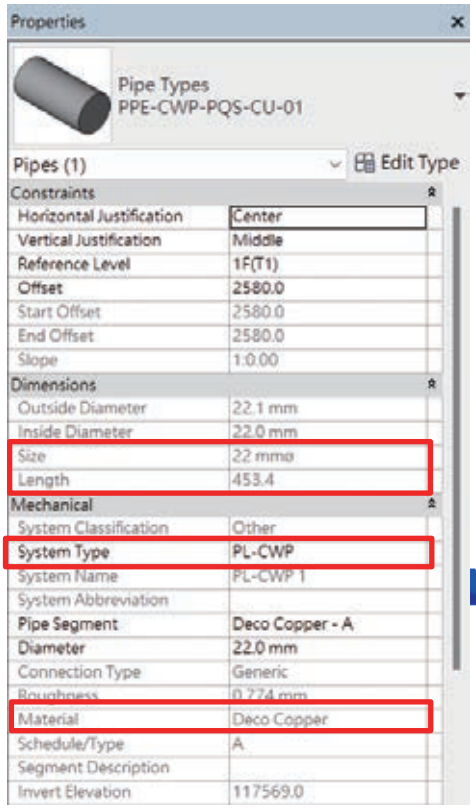
- Nil.

24.3 WATER SUPPLY PIPEWORK

24.3.1 BASIC MODELLING APPROACHES

Based on the pipes template, create a system family type for each type of pipes with routing set for different diameters and fittings, and place the individual object to the required alignment and length.

The relevant information that can be extracted from the parameters includes system type, pipe type, material, size, length, etc.



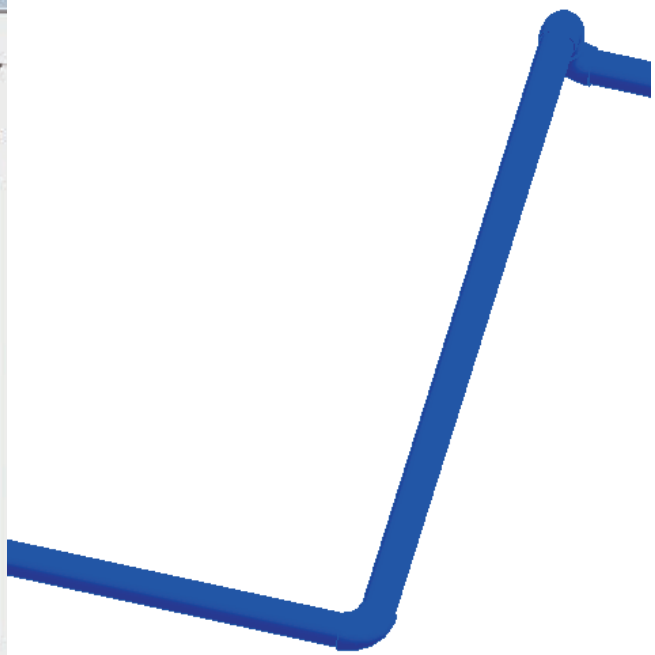


Figure 24.3.1 – 3D View of Pipework

24.3.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. System types.
2. Types, materials and nominal diameters of pipes.
3. Wrappings or insulations to pipes (if any).
4. Painting to pipes (if any).

24.3.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of pipes, create a schedule with the following fields, sorted by system type, pipe type & size, and summed up by groups:

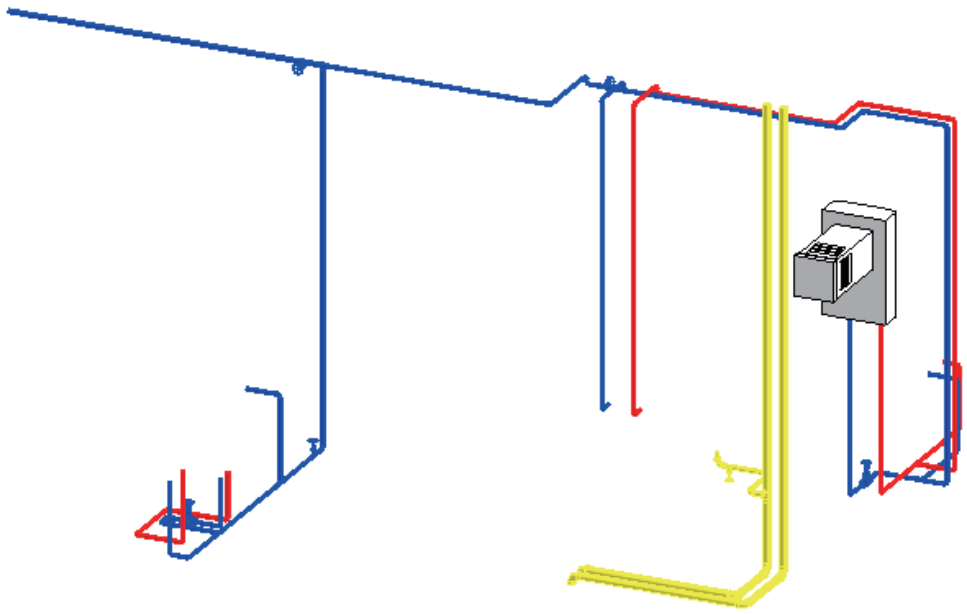

Figure 24.3.2 – 3D View of Pipework

<Pipe Schedule>

A	B	C	D	E	F
Type	System Type	Material	Size	Count	Length
PPE-CWP-PQS-CU-01	PL-CWP	Deco Copper	22 mmø	35	17343
PPE-CWP-PQS-CU-01	PL-CWP	Deco Copper	28 mmø	2	1903
PPE-FWP-PQS-PVC-01	PL-FWP	Plastic	20 mmø	5	506
PPE-FWP-PQS-PVC-01	PL-FWP	Plastic	32 mmø	9	8239
PPE-HWP-PQS-CU-01	PL-HWP	Deco Copper	22 mmø	19	10779

Also, a detailed schedule without summing up can also be created:

<Pipe Schedule>

A	B	C	D	E	F
Type	System Type	Material	Size	Count	Length
PPE-CWP-PQS-CU-01	PL-CWP	Deco Copper	22 mmø	1	453
PPE-CWP-PQS-CU-01	PL-CWP	Deco Copper	22 mmø	1	249
PPE-CWP-PQS-CU-01	PL-CWP	Deco Copper	22 mmø	1	442
PPE-CWP-PQS-CU-01	PL-CWP	Deco Copper	22 mmø	1	2333
PPE-CWP-PQS-CU-01	PL-CWP	Deco Copper	22 mmø	1	1387
PPE-CWP-PQS-CU-01	PL-CWP	Deco Copper	22 mmø	1	408
PPE-CWP-PQS-CU-01	PL-CWP	Deco Copper	22 mmø	1	330
PPE-CWP-PQS-CU-01	PL-CWP	Deco Copper	22 mmø	1	53
PPE-CWP-PQS-CU-01	PL-CWP	Deco Copper	22 mmø	1	789
PPE-CWP-PQS-CU-01	PL-CWP	Deco Copper	22 mmø	1	82
PPE-CWP-PQS-CU-01	PL-CWP	Deco Copper	22 mmø	1	431
PPE-CWP-PQS-CU-01	PL-CWP	Deco Copper	22 mmø	1	194
PPE-CWP-PQS-CU-01	PL-CWP	Deco Copper	22 mmø	1	506
PPE-CWP-PQS-CU-01	PL-CWP	Deco Copper	22 mmø	1	72

*The above image only shows part of the schedule.

Note:

- As an alternative rule in HKSMM5, pipework fixed to different backgrounds is not measured separately, and can be grouped together.

For pipework diameter > 110 mm

- The HKSMM5 stipulates that pipework is measured along the centre lines of pipes over all bends, junctions and other pipe fittings. Pipe fittings > 110 mm nominal diameter are enumerated as extra over pipework.
- There is an alternative rule in HKSMM5 that all pipe fittings > 110 mm nominal diameter are enumerated (instead of as extra over) for water supply systems, and pipework is measured along the centre lines of pipes only (i.e. not measured through pipe fittings).

For pipework diameter < = 110 mm

- For projects with full BIM information for pipework and fittings, the pipe lengths generated by Revit are the net lengths with gaps at fittings while HKSMM5 measures the pipe lengths through the fittings without deducting the gaps. Therefore, the Revit quantities for pipework < = 110 mm nominal diameter have to be adjusted to suit (e.g. adding the length of gaps x number of fittings by type).
- As an alternative, for measurement of pipework of size < = 110 mm nominal diameter, a special preamble should be given to measuring pipework along the centre lines of pipes only (i.e. not measured through pipe fittings), and all pipe fittings are enumerated.

Adjust for the following as necessary:

- See Note of 24.3.3 above.

24.4 ABOVE GROUND DRAINS

24.4.1 BASIC MODELLING APPROACHES

Based on the pipes template, create a system family type for each type of pipes with routing set for different diameters and fittings, and place the individual object in the designed location to the required alignment and length.

The relevant information that can be extracted from the parameters includes system type, pipe type, material, size, length, etc.

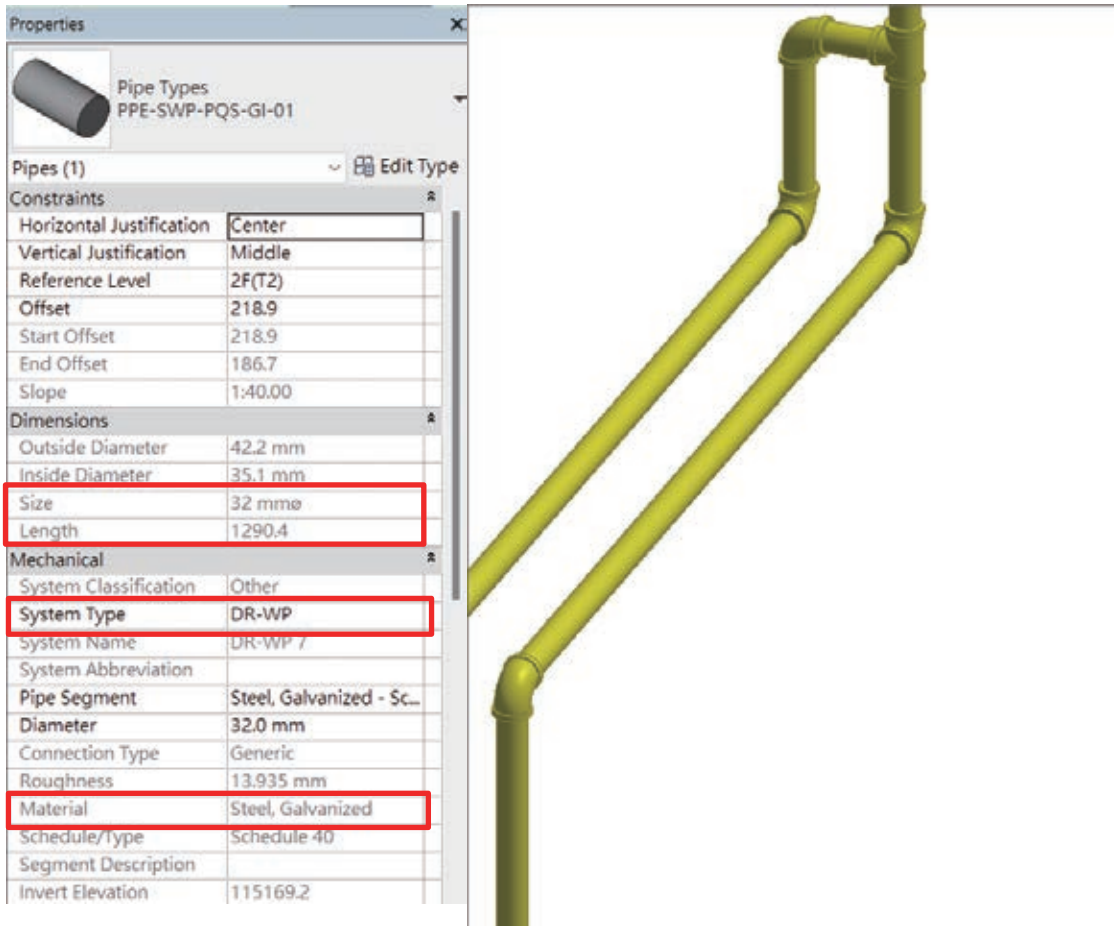

Figure 24.4.1 – 3D View of Drain Pipework

24.4.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. System types.
2. Types, materials and nominal diameters of drainpipes.
3. Painting to drainpipes (if any).

24.4.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of drainpipes, create a schedule with the following fields, sorted by system type, type & size, and summed up by groups:

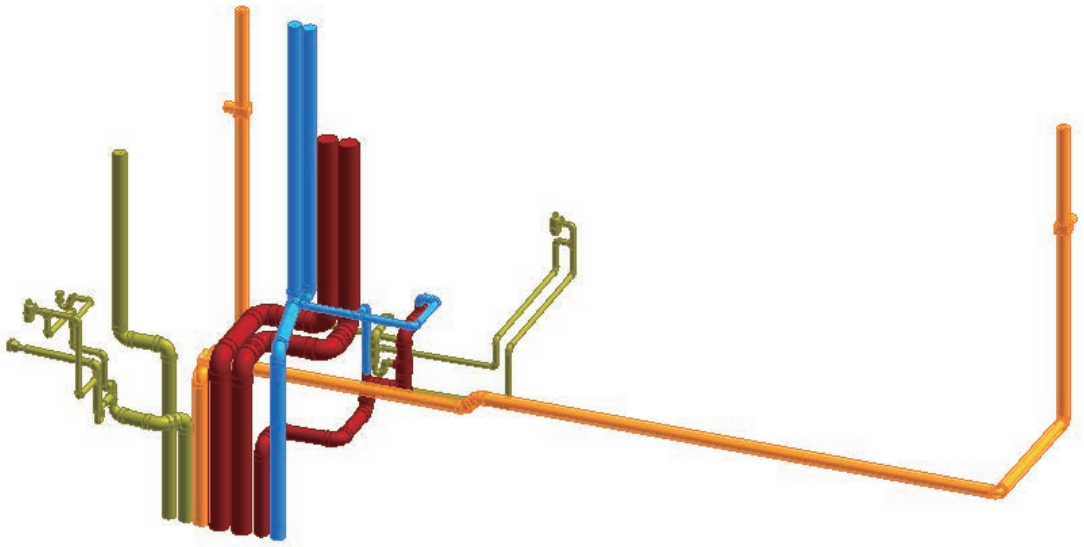

Figure 24.4.2 – 3D View of Drain Pipework

<Pipe Schedule>

A	B	C	D	E	F
Type	System Type	Material	Size	Count	Length
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	32 mmø	2	218
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	50 mmø	10	13619
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	80 mmø	3	1330
PPE-SWP-PQS-PVC-01	DR-SWP	Plastic	100 mmø	9	1714
PPE-SWP-PQS-PVC-01	DR-SWP	Plastic	150 mmø	9	6858
PPE-VP_-PQS-PVC-01	DR-VP	Plastic	50 mmø	8	1866
PPE-VP_-PQS-PVC-01	DR-VP	Plastic	100 mmø	4	7059
PPE-SWP-PQS-GI-01	DR-WP	Steel, Galvanized	32 mmø	15	5790
PPE-SWP-PQS-GI-01	DR-WP	Steel, Galvanized	40 mmø	15	3303
PPE-SWP-PQS-GI-01	DR-WP	Steel, Galvanized	50 mmø	8	1179
PPE-WP_-PQS-PVC-01	DR-WP	Plastic	40 mmø	1	9
PPE-WP_-PQS-PVC-01	DR-WP	Plastic	50 mmø	1	11
PPE-WP_-PQS-PVC-01	DR-WP	Plastic	100 mmø	6	4258

Also, a detailed schedule without summing up can also be created:

<Pipe Schedule>

A	B	C	D	E	F
Type	System Type	Material	Size	Count	Length
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	32 mmø	1	97
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	32 mmø	1	122
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	50 mmø	1	1880
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	50 mmø	1	881
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	50 mmø	1	1691
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	50 mmø	1	883
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	50 mmø	1	1239
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	50 mmø	1	470
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	50 mmø	1	4542
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	50 mmø	1	1943
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	50 mmø	1	37
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	50 mmø	1	52
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	80 mmø	1	1275
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	80 mmø	1	16
PPE-CDP-PQS-PVC-01	DR-CDP	Plastic	80 mmø	1	40

* The above image only shown part of the schedule

It should be noted that:

- As an alternative rule in HKSMM5, drainpipe fixed to different backgrounds is not measured separately, and all pipe fittings are enumerated.
- Lengths of pipes are the actual inclined length, not the horizontal length (as measured on plan).

For pipework diameter > 110 mm

- The HKSMM5 stipulates that the drainpipe is measured along the centre lines of pipes over all bends, junctions and other pipe fittings. Pipe fittings > 110 mm nominal diameter are enumerated as extra over pipework.
- There is an alternative rule in HKSMM5 that for above ground disposal systems all pipe fittings > 110 mm nominal diameter are enumerated (instead of as extra over), and drainpipe is measured along the centre lines of pipes only (i.e. not measured through pipe fittings).

For pipework diameter < = 110 mm

- For projects with full BIM information for pipework and fittings, the pipe lengths generated by Revit are the net lengths with gaps at fittings while HKSMM5 measures the pipe lengths through the fittings without deducting the gaps. Therefore, the Revit quantities for pipework < = 110 mm nominal diameter have to be adjusted to suit (e.g. adding the length of gaps x number of fittings by type).
- As an alternative, for measurement of pipework of size < = 110 mm nominal diameter, a special preamble should be given to measuring pipework along the centre lines of pipes only (i.e. not measured through pipe fittings), and all pipe fittings are enumerated.

Adjust for the following as necessary:

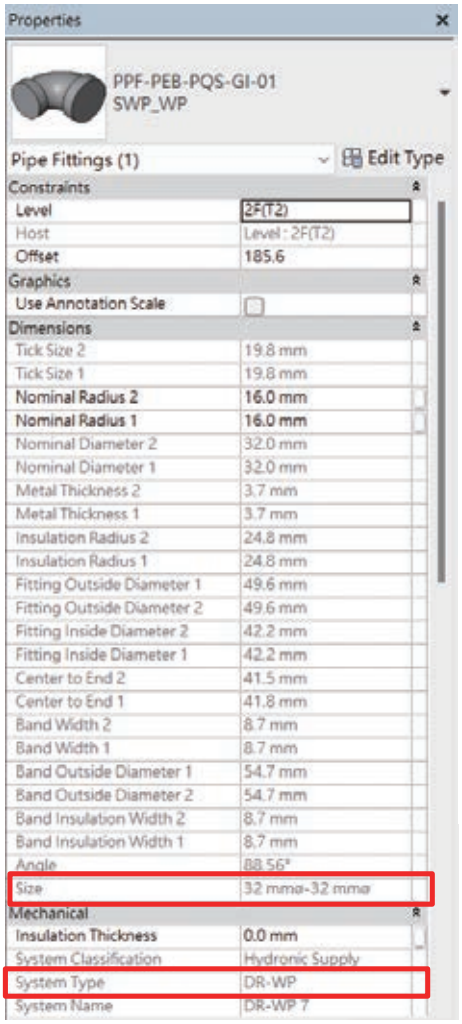
- See Note of 24.4.3 above.

24.5 PIPE FITTINGS

24.5.1 BASIC MODELLING APPROACHES

Based on the pipe fittings template, create a loadable family type for each type and size of pipe fittings to be placed automatically when joining two pipes or turning a pipe, or placed manually in the designed location.

The relevant information that can be extracted from the parameters includes system type, pipe fitting type, size, etc.



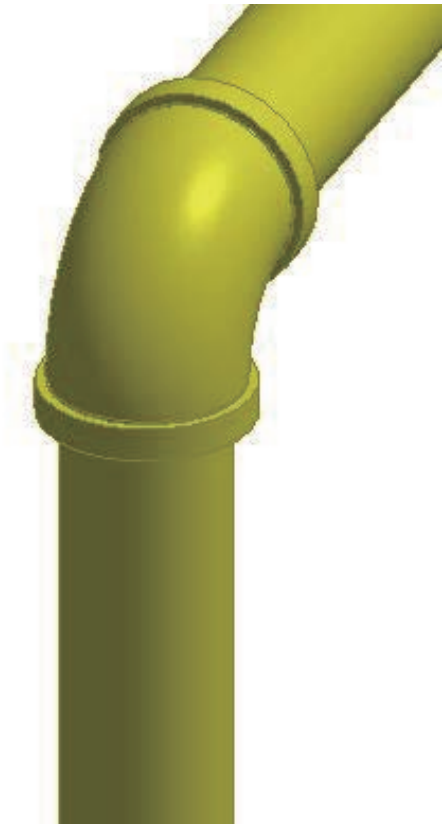


Figure 24.5.1 – 3D View of Bend

24.5.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. System types.
2. Types, materials, nominal diameters of pipe fittings.
3. Wrappings or insulations to pipe fittings (if any).
4. Painting to pipe fittings (if any).

24.5.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of pipe fittings, create a schedule with the following fields, sorted by system type, family & size, and summed up by groups:

<Pipe Fitting Schedule>

A	B	C	D	E
System Type	Family	Type	Size	Count
DR-CDP	PPF-PBD-PQS-PVC-01	CDP	50 mmø-50 mmø	6
DR-CDP	PPF-PBD-PQS-PVC-01	CDP	80 mmø-80 mmø	1
DR-CDP	PPF-PRD-PQS-PVC-01	CDP	80 mmø-50 mmø	1
DR-CDP	PPF-PTE-PQS-PVC-01	CDP	50 mmø-50 mmø-32 mmø	2
DR-CDP	PPF-PTE-PQS-PVC-01	CDP	80 mmø-80 mmø-50 mmø	1
DR-SWP	PPF-PBD-PQS-PVC-01	SWP_SWP	100 mmø-100 mmø	5
DR-SWP	PPF-PBD-PQS-PVC-01	SWP_SWP	150 mmø-150 mmø	7
DR-SWP	PPF-PTE-PQS-PVC-01	SWP_SWP	100 mmø-32 mmø-100 mmø	1
DR-SWP	PPF-PTE-PQS-PVC-01	SWP_SWP	100 mmø-50 mmø-100 mmø	1
DR-SWP	PPF-PTE-PQS-PVC-01	SWP_SWP	100 mmø-100 mmø-50 mmø	1
DR-SWP	PPF-PTE-PQS-PVC-01	VP	100 mmø-100 mmø-50 mmø	1
DR-VP	PPF-PBD-PQS-PVC-01	VP	50 mmø-50 mmø	5
DR-VP	PPF-PBD-PQS-PVC-01	VP	100 mmø-50 mmø	1
DR-VP	PPF-PBD-PQS-PVC-01	VP	100 mmø-100 mmø	2
DR-VP	PPF-PTE-PQS-PVC-01	VP	50 mmø-50 mmø-50 mmø	1
DR-WP	PPF-PBD-PQS-PVC-01	SWP_WP	100 mmø-50 mmø	1
DR-WP	PPF-PBD-PQS-PVC-01	SWP_WP	100 mmø-100 mmø	4
DR-WP	PPF-PEB-PQS-GI-01	SWP_WP	32 mmø-32 mmø	10
DR-WP	PPF-PEB-PQS-GI-01	SWP_WP	40 mmø-40 mmø	11
DR-WP	PPF-PEB-PQS-GI-01	SWP_WP	50 mmø-50 mmø	2
DR-WP	PPF-PTE-PQS-GI-01	SWP_WP	32 mmø-32 mmø-32 mmø	1
DR-WP	PPF-PTE-PQS-GI-01	SWP_WP	40 mmø-32 mmø-32 mmø	1
DR-WP	PPF-PTE-PQS-GI-01	SWP_WP	40 mmø-40 mmø-32 mmø	1
DR-WP	PPF-PTE-PQS-GI-01	SWP_WP	40 mmø-40 mmø-40 mmø	1
DR-WP	PPF-PTE-PQS-GI-01	SWP_WP	50 mmø-40 mmø-50 mmø	1
DR-WP	PPF-PTE-PQS-GI-01	SWP_WP	50 mmø-50 mmø-32 mmø	1
DR-WP	PPF-PTE-PQS-GI-01	SWP_WP	50 mmø-50 mmø-40 mmø	1

Note:

- There is an alternative rule in HKSMM5 that for above ground water supply and disposal systems all pipe fittings > 110 mm nominal diameter are enumerated (instead of as extra over), and drainpipe is measured along the centre lines of pipes only (i.e. not measured through pipe fittings).
- For projects with full BIM information for pipework and fittings, suggest adding a special preamble for measuring all sizes of pipework along the centre lines of pipes only (i.e. not measured through pipe fittings), and all pipe fittings are enumerated.
- Refer to sections 24.3.3 and 24.4.3 above.

Adjust for the following as necessary:

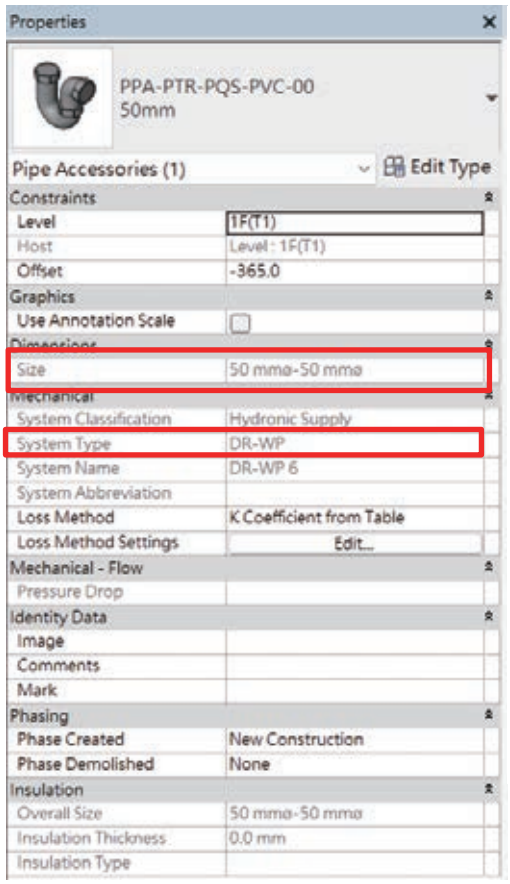
- See Note in 24.5.3 above.

24.6 PIPE ACCESSORIES

24.6.1 BASIC MODELLING APPROACHES

Based on the pipe accessories template, create a loadable family type for each type and size of accessories, and place the individual object in the designed location.

The relevant information that can be extracted from the parameters includes system type, pipe accessory type, size, etc.



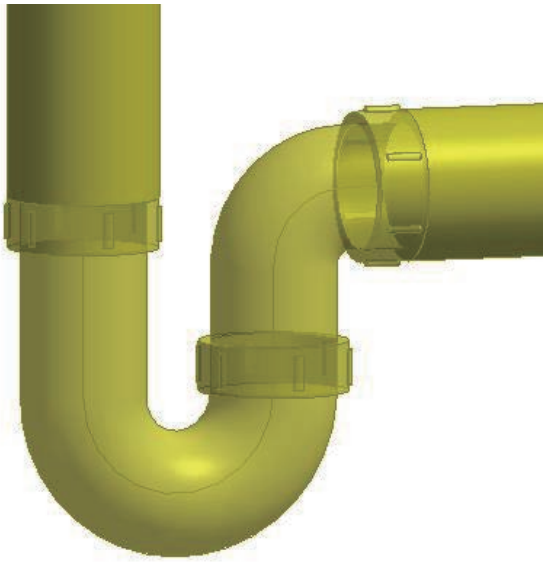


Figure 24.6.1 – 3D View of P Trap

24.6.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. System types.
2. Types, materials and nominal sizes of pipe accessories.
3. Painting to pipe accessories (if any).

24.6.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of pipe accessories, create a schedule with the following fields, sorted by system type, family & size, and summed up by groups:

<Pipe Accessory Schedule>

A	B	C	D	E
System Type	Family	Type	Size	Count
DR-WP	PPA-ABT-PQS-PVC-00	32mm	32 mmø-32 mmø	1
DR-WP	PPA-ABT-PQS-PVC-00	40mm	40 mmø-40 mmø	1
DR-WP	PPA-DBB-PQS-PVC-00	40mm	40 mmø-32 mmø-32 mmø	1
DR-WP	PPA-MPT-PQS-PVC-00	32mm	32 mmø-32 mmø	1
DR-WP	PPA-PTR-PQS-PVC-00	50mm	50 mmø-50 mmø	2
DR-WP	PPA-VFD-PQS-PVC-00	50mm	50 mmø	2

Note:

- According to HKSMM5, pipework is not measured through pipe accessories and ancillaries, and this matches Revit's measurement.

Adjust for the following as necessary:

- Nil.

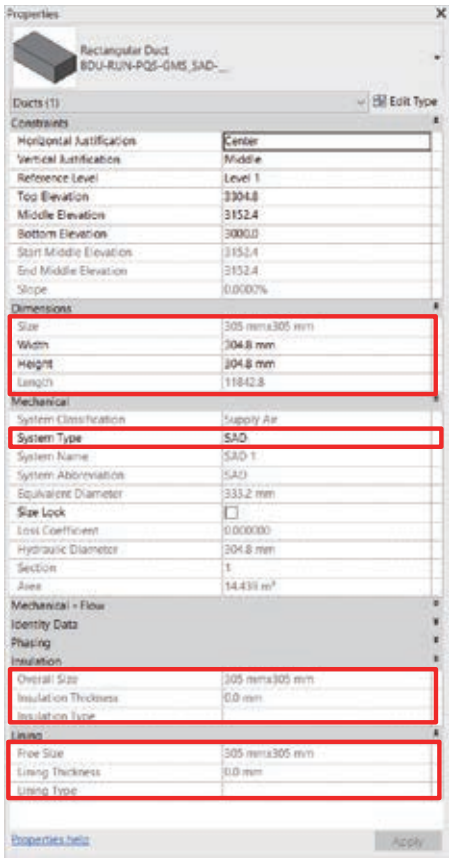
SECTION 25 – MECHANICAL SYSTEMS

25.1 DUCTWORK

25.1.1 BASIC MODELLING APPROACHES

Based on the ducts template, create a system family type for each type and cross-sectional size of ducts with routing set for different sizes and fittings, and place the individual object in the designed location to the required alignment and length.

The relevant information that can be extracted from the parameters includes system type, ductwork type, size, length, etc.



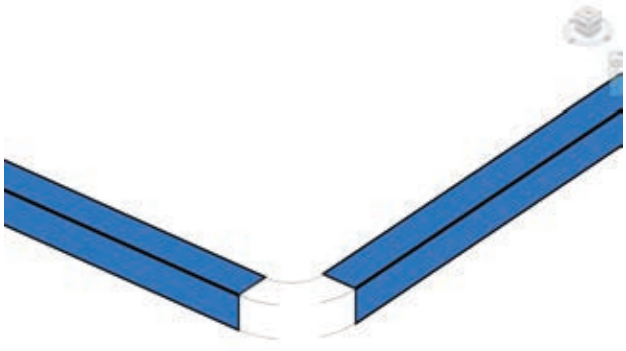


Figure 25.1.1 – 3D View of Ductwork

25.1.1 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. System types.
2. Types, materials, qualities, cross-sectional dimensions and gauge or thicknesses of ductwork.
3. Wrappings & insulations/linings to ductwork (if any).
4. Painting to ductwork.
5. Specification.

25.1.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of ductwork, create a schedule with the following fields:

<Duct Schedule>

A	B	C	D	E	F	G	H
Family	Type	Width	Height	System Type	System Classification	System Name	Length
Rectangular Duct	BDU-RUN-PQS-GMS_EAD-__	305 mm	305 mm	EAD	Exhaust Air	EAD 1	3843
Rectangular Duct	BDU-RUN-PQS-GMS_EAD-__	305 mm	305 mm	EAD	Exhaust Air	EAD 1	4343
Rectangular Duct	BDU-RUN-PQS-GMS_EAD-__	305 mm	305 mm	EAD	Exhaust Air	EAD 1	342
Rectangular Duct	BDU-RUN-PQS-GMS_SAD-__	305 mm	305 mm	SAD	Supply Air	SAD 1	11843
Rectangular Duct	BDU-RUN-PQS-GMS_SAD-__	305 mm	305 mm	SAD	Supply Air	SAD 1	2031
Rectangular Duct	BDU-RUN-PQS-GMS_SAD-__	305 mm	305 mm	SAD	Supply Air	SAD 1	13362
Round Duct	Default			SAD	Supply Air	SAD 2	3843
Round Duct	Default			SAD	Supply Air	SAD 2	3826

Note:

- In HKSMM5, the rates for mechanical systems cover setting and fixing in position on any background.
- Ductwork rectangular in section is measured the nett area of sheet material fabricated over all in-line fittings, short running, and branches, but not through in-line equipment.
- Ductwork circular or oval in section is measured along the centre lines of the duct and in-line fittings but not through in-line equipment. In-line fittings are measured extra over the circular or oval ducts.
- Where an in-line reduction in size occurs at a reducer or tee etc., the largest size shall be measured for the full length of the fitting.
- For projects with full BIM information for ductwork and fittings, suggest adding a special preamble for measuring all ductwork along the centre lines of ducts but not through in-line fittings; and all in-line fittings are enumerated.

Adjust for the following as necessary:

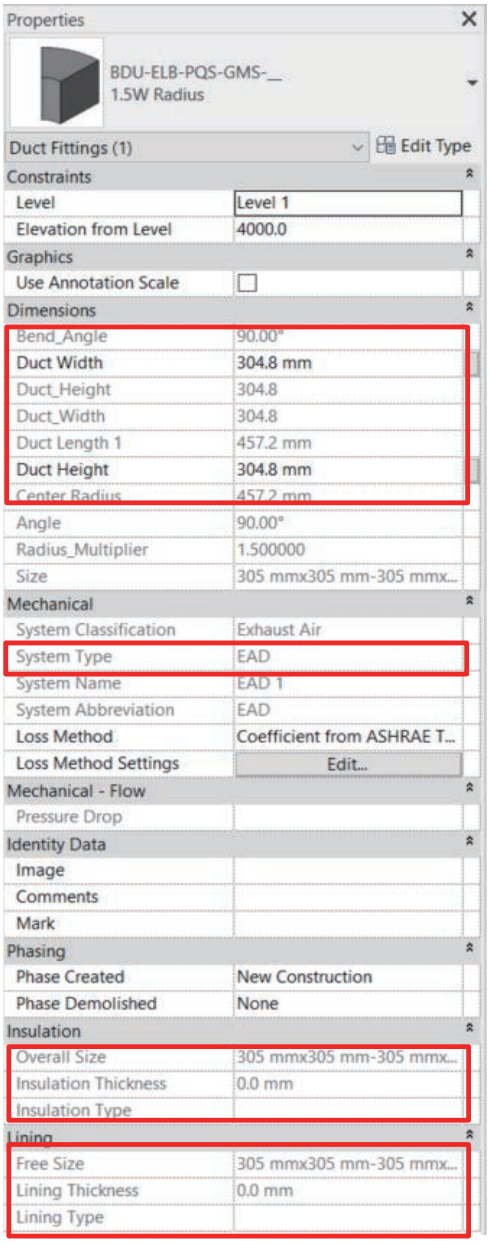
- See Note in 25.1.3 above.

25.2 DUCT FITTINGS

25.2.1 BASIC MODELLING APPROACHES

Based on the duct fittings template, create a loadable family type for each type and size of duct fittings to be placed automatically when connecting two ducts or turning a duct, or placed manually.

The relevant information that can be extracted from the parameters includes system type, duct fitting type, size, etc.



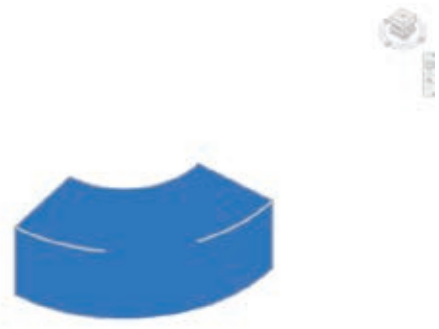


Figure 25.2.1 – 3D View of Duct Fitting

For Duct Width, Height, Angle and Center Radius of the duct fittings, Shared Parameters should be created for scheduling.

25.2.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. System types.
2. Duct marks.
3. Types, materials, qualities , cross-sectional dimensions and thicknesses of duct fittings.
4. Wrappings & insulations/linings to duct fittings (if any).
5. Painting to duct fittings.
6. Specification.

25.2.3 QUANTITY TAKE-OFF GUIDELINES

(A) For measurement of rectangular duct fittings, create a schedule with the following fields:

<Duct Fitting Schedule>

A	B	C	D	E	F	G	H	I	J
Family	Type	System Type	Bend_Angle	Radius_Multiplier	Duct_Height	Duct_Width	Count	Duct Fitting Length	Duct Fitting Area
BDU-ELB-PQS-GMS-_	1.5W Radius	EAD	90.00°	1.5	305	305	1	718 mm	0.875 m²
BDU-ELB-PQS-GMS-_	1.5W Radius	EAD	90.00°	1.5	305	305	1	718 mm	0.875 m²

Note:

- "Centre Radius multiplier" is given in the type name, being 1.5 times of duct width (W).
- "Duct Length" from default parameters should not be used to calculate the actual length of ductwork.
- Based on HKSMM5, rectangular ductwork is measured the nett area of sheet material fabricated over all in-line fittings, short running and branches.
- For calculating nett area of sheet materials of this fitting, set the following formulae:
  *Duct Fitting Length (along centre line) = 2π * (1.5 * Duct_Width) * (Bend_Angle/360°)*
  *Duct Fitting Nett Area = 2 * (Duct_Width + Duct_Height) * Duct Fitting Length*

(B) For measurement of circular or oval duct fittings, create a schedule with the following fields:

<Round Duct Fitting Schedule>

A	B	C	D	E	F	G	H
Family	Type	System Type	Bend_Angle	Radius_Multiplier	Duct_Diameter	Count	Duct Fitting Length
BDU-REL-PQS-GMS-__	1.5 Dia. Radius	SAD	90.00°	1.5	305	1	718 mm

Note:

- "Centre Radius multiplier" is given in type name, being 1.5 times of duct diameter.
- "Duct Length" from default parameters should not be used to calculate the actual length of ductwork.
- Based on HKSMM5, circular ductwork is measured along the centre lines of ducts and in-line fittings, with extra overs in-line fittings being enumerated.
- For calculating the length of fittings, set the following formulae:
  *Duct Fitting Length = 2π * (1.5 * Duct_Diameter) * (Bend_Angle/360°)*

It is suggested that:

- For projects with full BIM information for ductwork and fittings, add a special preamble for measuring all ductwork along the centre lines of ducts (i.e. not measured through in-line fittings), and all in-line fittings are enumerated.

Adjust for the following as necessary:

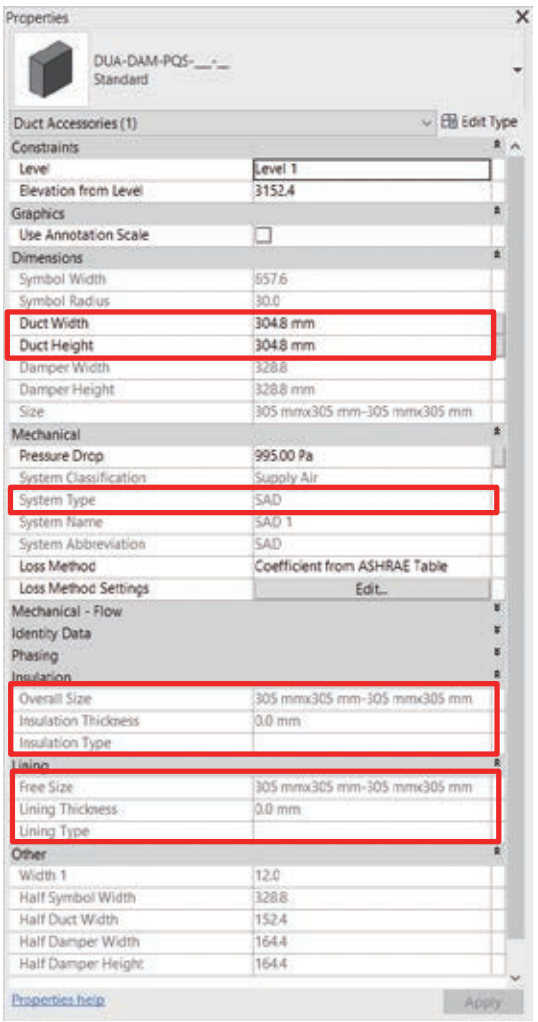
- Nil.

25.3 DUCT ANCILLARIES

25.3.1 BASIC MODELLING APPROACHES

Based on the duct accessories template, create a loadable family type for each type and size of duct ancillaries, and place the individual object in the designed location.

The relevant information that can be extracted from the parameters includes system type, duct accessory type, size, etc.



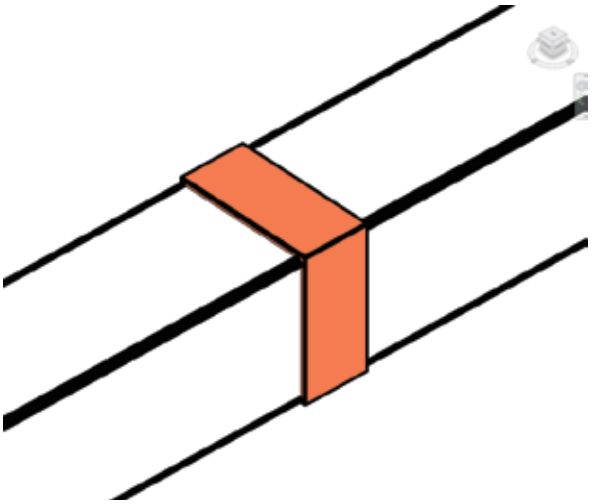


Figure 25.3.1 – 3D View of a Duct Damper

25.3.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. System types.
2. Duct ancillary types.
3. Types, materials, qualities, and sizes of duct ancillaries.
4. Wrappings & insulation/lining to duct ancillaries (if any).
5. Painting to duct ancillaries.
6. Specification.

25.3.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of duct ancillaries, create a schedule with the following fields:

<Duct Ancillary Schedule>

A	B	C	D
Family	Type	System Type	Count
DUA-DAM-PQS-___-__	Standard	SAD	1

Adjust for the following as necessary:

- Nil.

26.1 CABLE TRAYS

26.1.1 BASIC MODELLING APPROACHES

Based on the cable trays template, create a system family type for each type and cross-sectional size of cable trays with routing set for different sizes and fittings, and place the individual object in the designed location to the required alignment and length.

The relevant information that can be extracted from the parameters includes cable tray type, size, length, etc.

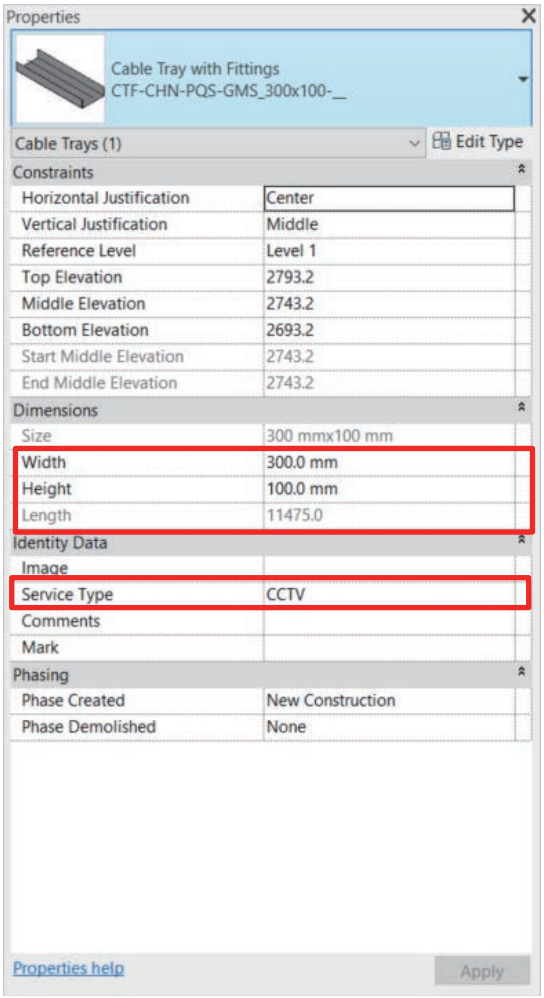

Figure 26.1.1 – 3D View of Cable Tray

26.1.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. System types.
2. Cable tray types.
3. Types, materials, qualities and cross-sectional dimensions of cable trays.
4. Painting to cable trays (if any).

26.1.3 QUANTITY TAKE-OFF GUIDELINES

For the measurement of cable trays, create a schedule with the following fields:

<Cable Tray Schedule>

A	B	C	D	E	F
Family	Type	Service Type	Width	Height	Length
Cable Tray with Fittings	CTF-CHN-PQS-GMS_300x100-__	CCTV	300 mm	100 mm	11475
Cable Tray with Fittings	CTF-CHN-PQS-GMS_300x100-__	CCTV	300 mm	100 mm	4013
Cable Tray with Fittings	CTF-CHN-PQS-GMS_300x100-__	CCTV	300 mm	100 mm	1139
Cable Tray with Fittings	CTF-CHN-PQS-GMS_300x100-__	CCTV	300 mm	100 mm	6713
Cable Tray with Fittings	CTF-CHN-PQS-GMS_300x100-__	CCTV	300 mm	100 mm	1350
Cable Tray with Fittings	CTF-CHN-PQS-GMS_300x100-__	Telecom	300 mm	100 mm	1118
Cable Tray with Fittings	CTF-CHN-PQS-GMS_300x100-__	Telecom	300 mm	100 mm	750
Cable Tray with Fittings	CTF-CHN-PQS-GMS_300x100-__	Telecom	300 mm	100 mm	450
Cable Tray with Fittings	CTF-CHN-PQS-GMS_300x100-__	Telecom	300 mm	100 mm	3050
Cable Tray with Fittings	CTF-CHN-PQS-GMS_300x100-__	Telecom	300 mm	100 mm	850
Cable Tray with Fittings	CTF-CHN-PQS-GMS_300x100-__	Telecom	300 mm	100 mm	3275
Cable Tray with Fittings	CTF-CHN-PQS-GMS_300x100-__	Telecom	300 mm	100 mm	1350
Cable Tray with Fittings	CTF-CHN-PQS-GMS_300x100-__	Telecom	300 mm	100 mm	1118
Cable Tray with Fittings	CTF-CHN-PQS-GMS_300x100-__	Telecom	300 mm	100 mm	818
Cable Tray with Fittings	CTF-CHN-PQS-GMS_300x100-__	Telecom	300 mm	100 mm	1650

Note:

- According to HKSMM5, trays are measured along the centre line over all fittings, short lengths, and branches.
- Fittings > 200mm wide are measured as extra over trays. There is an alternative rule that such tray fittings are not measured separately but are included under trays. Notwithstanding this, the measurement of trays remains unchanged.
- For projects with full BIM information for trays and tray fittings, suggest adding a special preamble for measuring all trays along the centre lines of the trays but not measured through tray fittings; and all tray fittings are enumerated separately but not as extra over trays.
- Express statements required: The alternative rules apply only if expressly so stated.

Adjust for the following as necessary:

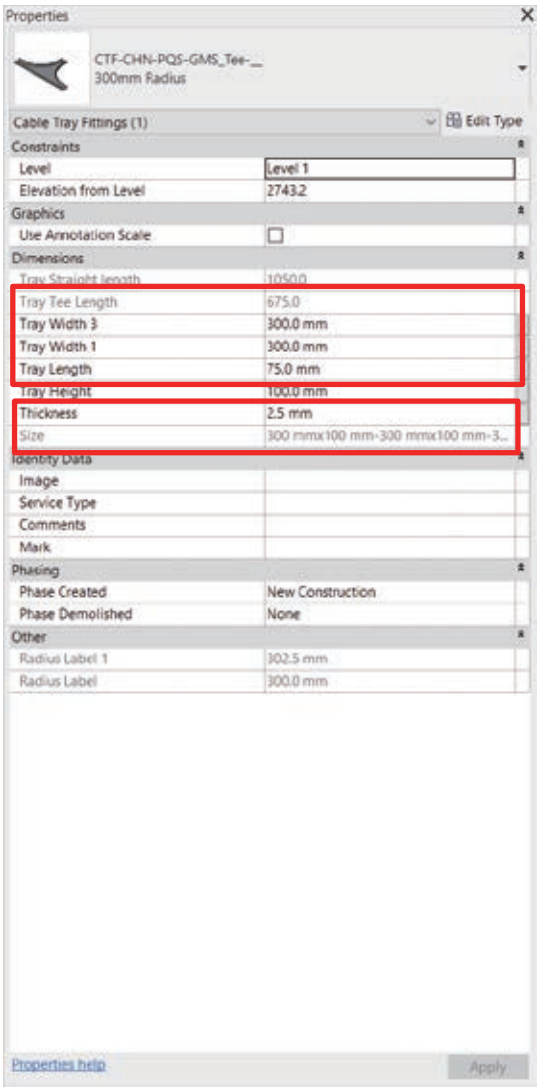
- Nil.

26.2 TRAY FITTINGS

26.2.1 BASIC MODELLING APPROACHES

Based on the tray fittings template, create a loadable family type for each type and size of tray fittings to be placed automatically when connecting two cable trays or turning a tray, or placed manually in the designed location.

The relevant information that can be extracted from the parameters includes tray fitting type, size, etc.



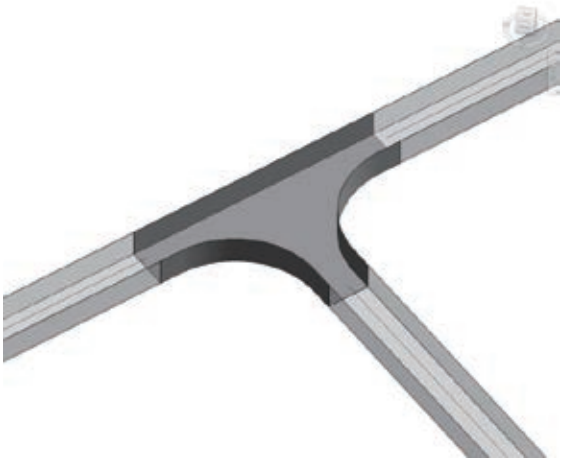


Figure 25.2.1 – 3D View of Cable Tray Fitting

26.2.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. System types.
2. Materials, qualities and sizes of tray fittings.
3. Sizes of tray fittings.
4. Painting to tray fittings (if any).

26.2.3 QUANTITY TAKE-OFF GUIDELINES

For measurement of tray fittings, create a schedule with the following fields:

<Cable Tray Fitting Schedule>

A	B	C	D	E	F	G	H	I
Family	Type	Size	Count	Tee Straight Length	Tee-out length	Bend Radius (Cente	Fitting Bend Angle	Fitting Length
CTF-CHN-PQS-GMS_Bend-__	300mmx100mm	300 mmx100 mm-300 mmx100 mm	1			450	90.00°	707
CTF-CHN-PQS-GMS_Bend-__	300mmx100mm	300 mmx100 mm-300 mmx100 mm	1			450	90.00°	707
CTF-CHN-PQS-GMS_Bend-__	300mmx100mm	300 mmx100 mm-300 mmx100 mm	1			450	90.00°	707
CTF-CHN-PQS-GMS_Bend-__	300mmx100mm	300 mmx100 mm-300 mmx100 mm	1			450	90.00°	707
CTF-CHN-PQS-GMS_Bend-__	300mmx100mm	300 mmx100 mm-300 mmx100 mm	1			450	90.00°	707
CTF-CHN-PQS-GMS_Bend-__	300mmx100mm	300 mmx100 mm-300 mmx100 mm	1			450	90.00°	707
CTF-CHN-PQS-GMS_Bend-__	300mmx100mm(600R)	300 mmx100 mm-300 mmx100 mm	1			750	90.00°	1178
CTF-CHN-PQS-GMS_Tee-__	300mm Radius	300 mmx100 mm-300 mmx100 mm-300 mmx100 mm	1	1050	525			
CTF-CHN-PQS-GMS_Tee-__	300mm Radius	300 mmx100 mm-300 mmx100 mm-300 mmx100 mm	1	1050	525			
CTF-CHN-PQS-GMS_Tee-__	300mm Radius	300 mmx100 mm-300 mmx100 mm-300 mmx100 mm	1	1050	525			
CTF-CHN-PQS-GMS_Tee-__	300mm Radius	300 mmx100 mm-300 mmx100 mm-300 mmx100 mm	1	1050	525			

Note:

- "Tray Length" from default parameters should not be used to calculate the actual length of tray.
- For Bends, shared parameters "Bend Radius (Centerline)" & "Fitting Bend Angle" are added for scheduling.
- Set the following formula to calculate the fitting lengths to be added to tray lengths:
  *Fitting Length (along centre line) = 2π * (Bend Radius (Centerline)) * (Fitting Bend Angle / 360°)*
- For Tees, shared parameters "Tee Straight Length" and "Tee-out length" are added to extract the length. See the diagram below:

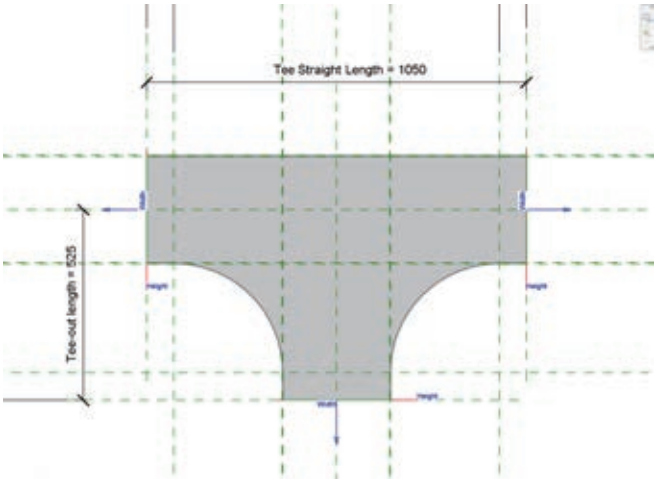

Figure 26.2.1 – Plan of Tray Fitting Family

- For projects with full BIM information for trays and tray fittings, suggest adding a special preamble for measuring all trays along the centre lines of the trays but not measured through tray fittings; and all tray fittings are enumerated.

Adjust for the following as necessary:

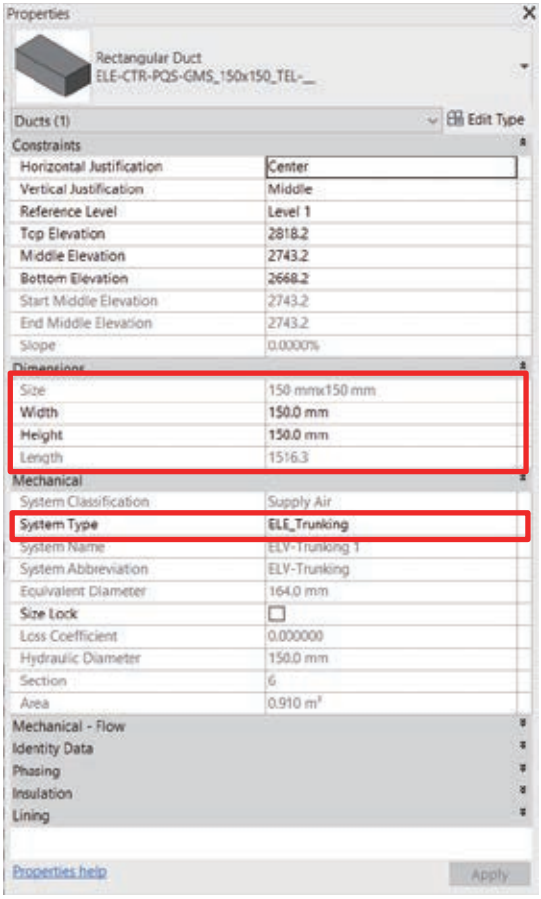
- Nil.

26.3 TRUNKING

26.3.1 BASIC MODELLING APPROACHES

Based on the ducts template, create a system family type for each type and cross-sectional size of trunking, and place the individual object in the designed location to the required alignment and length.

The relevant information that can be extracted from the parameters include trunking type, size, length, etc.



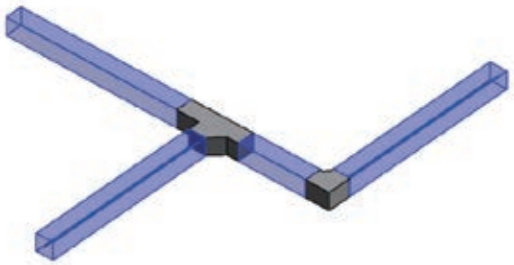


Figure 25.3.1 – 3D View of Cable Trunking

26.3.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. System types.
2. Types, materials, qualities and cross-sectional dimensions of trunking.
3. Numbers and sizes of compartments.
4. Types of covers.
5. Painting to trunking (if any).

26.3.3 QUANTITY TAKE-OFF GUIDELINES

For the measurement of trunkings, create a schedule with the following fields:

<Cable Trunking Schedule>

A	B	C	D	E
Family	Type	System Abbreviation	System Name	Length
Rectangular Duct	ELE-CTR-PQS-GMS_150x150_TEL-__	ELV-Trunking	ELV-Trunking 1	1565
Rectangular Duct	ELE-CTR-PQS-GMS_150x150_TEL-__	ELV-Trunking	ELV-Trunking 1	1525
Rectangular Duct	ELE-CTR-PQS-GMS_150x150_TEL-__	ELV-Trunking	ELV-Trunking 1	1516
Rectangular Duct	ELE-CTR-PQS-GMS_150x150_TEL-__	ELV-Trunking	ELV-Trunking 1	598

Note:

- According to HKSMM5, trunking is measured along the centre line over all trunking fittings, short lengths, and branches.
- Fittings > 200 mm wide or high are measured as extra over trunking. There is an alternative rule that such trunking fittings are not measured separately but are included under trunking. Notwithstanding this, the measurement of trunking remains unchanged.
- For projects with full BIM information for trunking and trunking fittings, suggest adding a special preamble for measuring all trunkings along the centre lines of the trunkings but not measured through trunking fitting; and all trunking fittings are enumerated.

Adjust for the following as necessary:

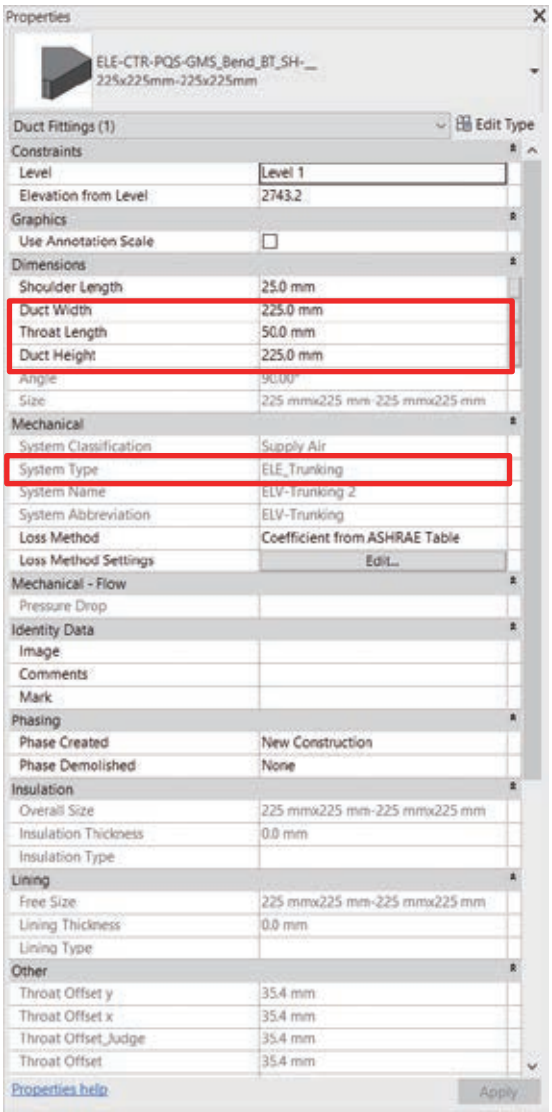
- Nil.

26.4 TRUNKING FITTINGS

26.4.1 BASIC MODELLING APPROACHES

Based on the duct fittings template, create a loadable family type for each type and size of trunking fittings to be placed automatically when connecting two trunkings or turning a trunking, or placed manually in the designed location.

The relevant information that can be extracted from the parameters includes system type, trunking fitting type, size, etc.



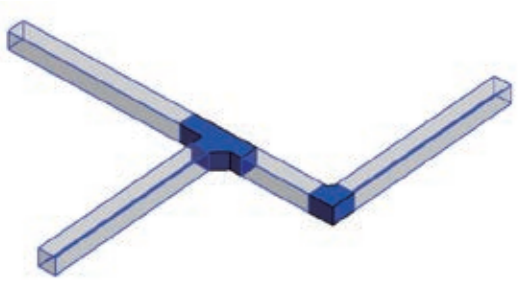


Figure 26.4.1 – 3D View of cable trunking fitting

26.4.2 INFORMATION REQUIREMENTS FOR QUANTITY TAKE-OFF

1. System types.
2. Trunking fitting types.
3. Types, materials, qualities and sizes of trunking fittings.
4. Painting to trunking fittings (if any).

26.4.3 QUANTITY TAKE-OFF GUIDELINES

For the measurement of trunking fittings, create a schedule with the following fields:

<Trunking Fitting Schedule>

A	B	C	D	E	F	G
Family	Type	System Abbreviation	System Name	Tee Straight Length	Tee-out length	Count
ELE-CTR-PQS-GMS_Bend_BT_SH-__	225x225mm-225x225mm	ELV-Trunking	ELV-Trunking 2			1
ELE-CTR-PQS-GMS_REDUCINGTEE-__	225x225mm- 225x225mm - 225x225mm	ELV-Trunking	ELV-Trunking 2	475	225	1

Note:

- According to HKSMM5, the gap length at trunking fittings must be added to the Revit trunking lengths to get the SMM compliant quantities.
- Add shared parameters “Tee Straight Length” and “Tee-out length” to report the dimensions of the fittings. The length calculated should be added to the trunking length.

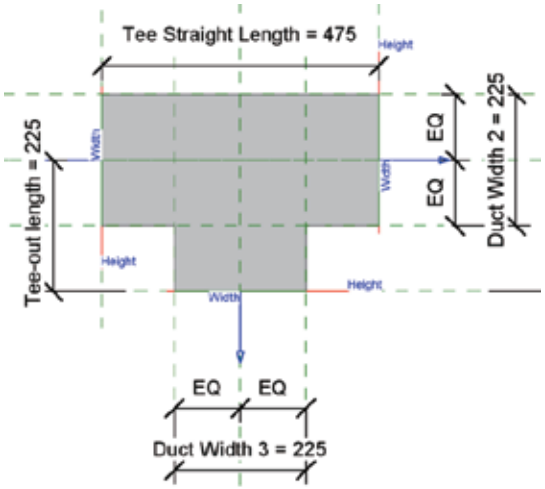

Figure 26.4.2 – Plan of fitting family

- For projects with full BIM information for trunkings and trunking fittings, suggest adding a special preamble for measuring all trunkings along the centre lines of the trunkings (i.e. not measured through trunking fittings), and all trunking fittings are enumerated.

Adjust for the following as necessary:

- Nil.

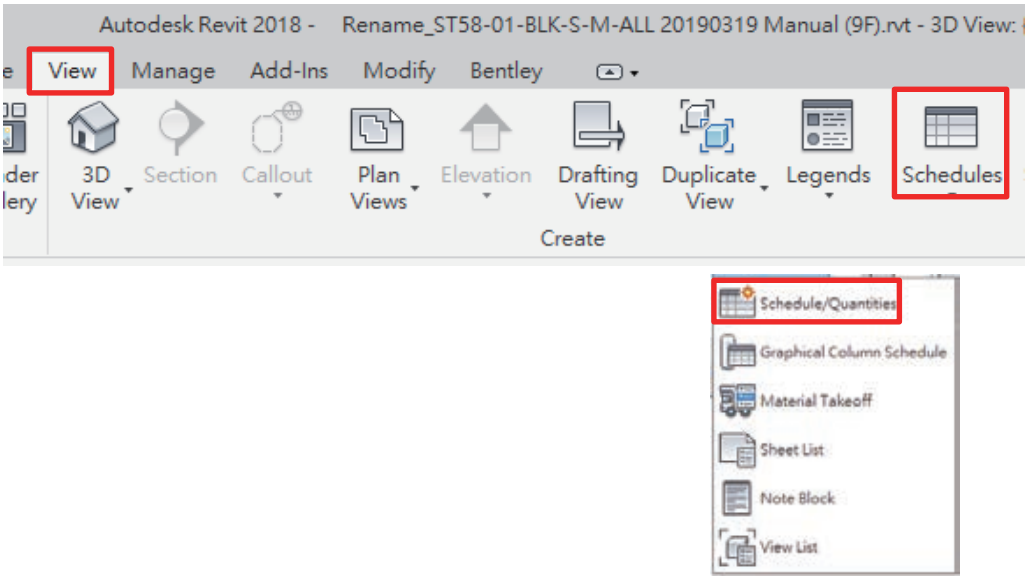
Part C – Essential Skills in Creating Schedules, Quantity Extraction and Generation from BIM Models

SECTION 27 – SCHEDULES AND MATERIAL TAKE-OFF SCHEDULES

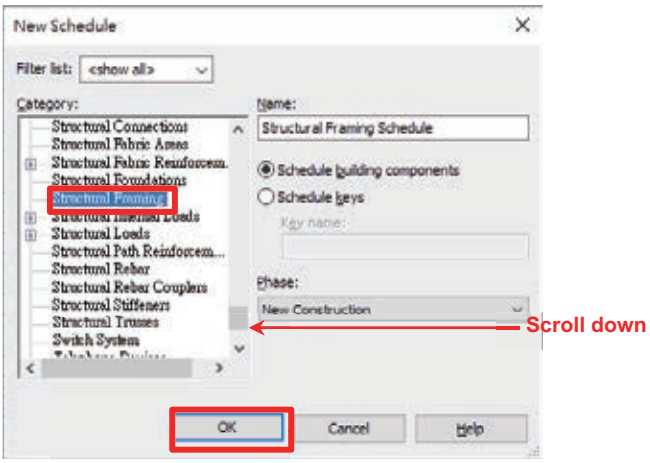
In Revit, Schedules/Material Take-off Schedules are used for extracting information and dimensions/quantities of model elements. Only Material Take-off Schedules can extract the material quantities of the elements, e.g., the area applied by the **Modify > Paint** tool.

27.1 CREATE SCHEDULES

27.1.1 Click **View** > **Schedules** > **Schedules/Quantities**:



27.1.2 Select the required category of the new schedule, e.g., Select "**Structural Framing**":

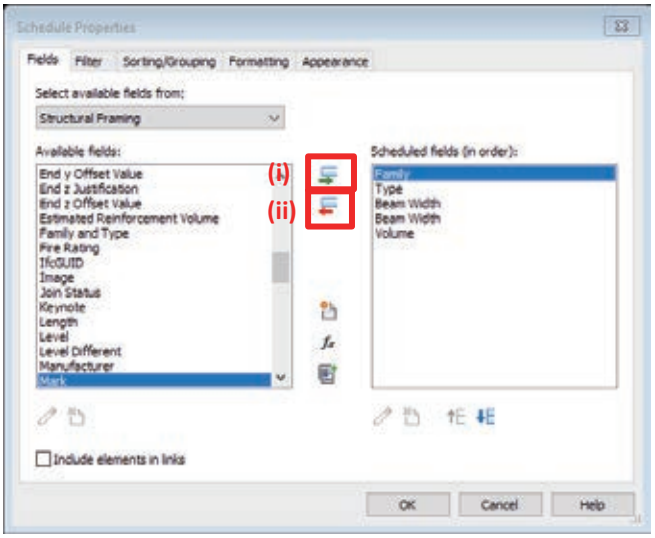


27.1.3 Select available fields to be included in the schedule:

A. Add/Remove parameters:

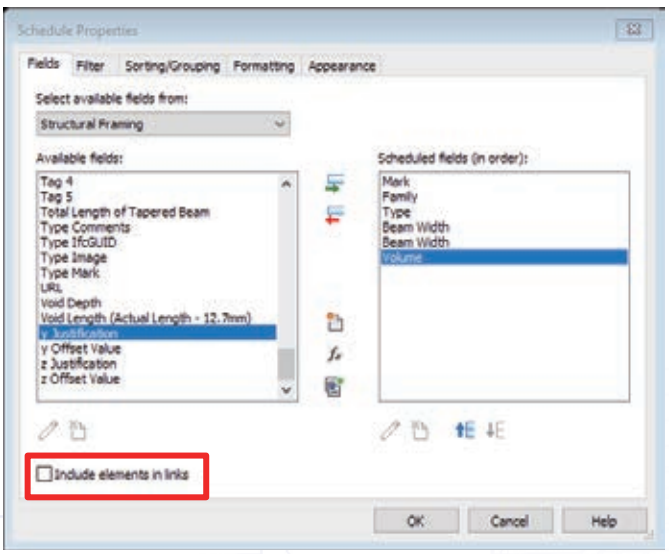
a. Add the required parameters: Double click the required parameter in "**Available fields**" column or click the required parameter in "**Available fields**" column and then click the button.

b. Remove unwanted parameters: Double click the unwanted parameter in "**Schedule fields**" column, e.g., "Volume" or select the unwanted parameter in "**Scheduled fields**" column and then click the button.



B. Include elements in linked files:

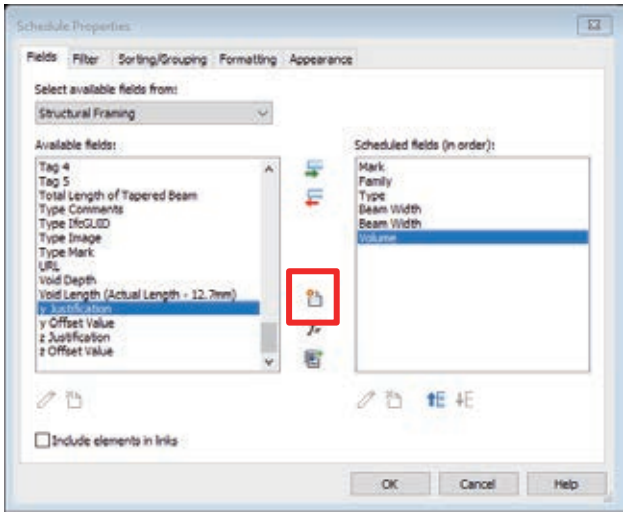
If there are linked files in the model, select "**Include elements in links**" to include the elements from the linked files into the schedule:



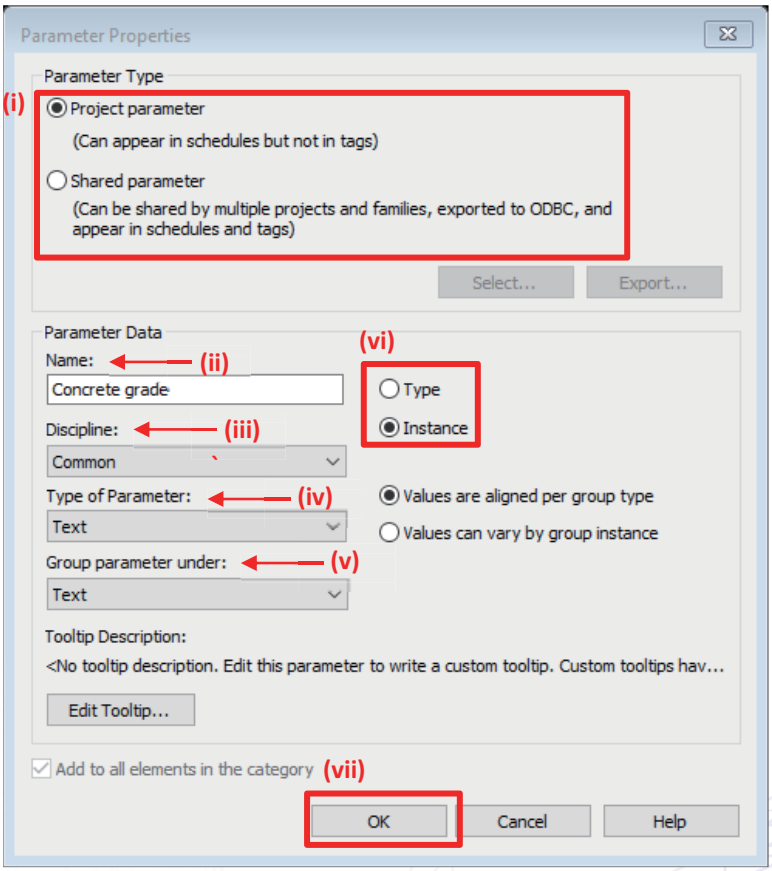
C. Create a new parameter:

For a parameter that cannot be found in the "**Available fields**" column, it can be created in the schedule, e.g., Add "**Concrete grade**" to the schedule.

a. Click the "**New parameter**" button  :



b. Complete the information for the new parameter:



(i) Select the parameter type (project parameter or shared parameter).

Note: Project parameters are specific to a single project file and are used for scheduling, sorting, and filtering in a project, but cannot be tagged. Shared parameters can be used in multiple families or projects, and can be tagged and scheduled.

(ii) Input the name of parameter.

(iii) Select the discipline of parameter to be assigned.

(iv) Select the type of parameter.

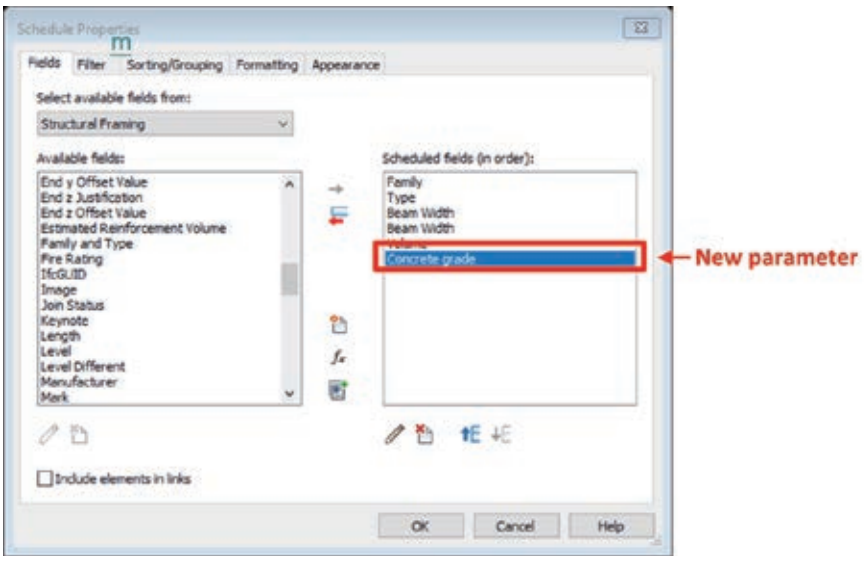
Note: The type of parameter is chosen based on the selected discipline. For example, "Text" is for data information.

(v) Select the parameter to be grouped.

(vi) Select the type of properties.

Note: Type property is a value same to all elements in a family. Changing the value of a type property affects all current and future instances of that family type. Instance properties can be assigned to all elements of a particular family type, and the values of instance properties may vary. Changing the value of an instance property affects the selected element only.

(vii) Click the **OK** button OK to confirm. The new parameter will appear in the scheduled fields:

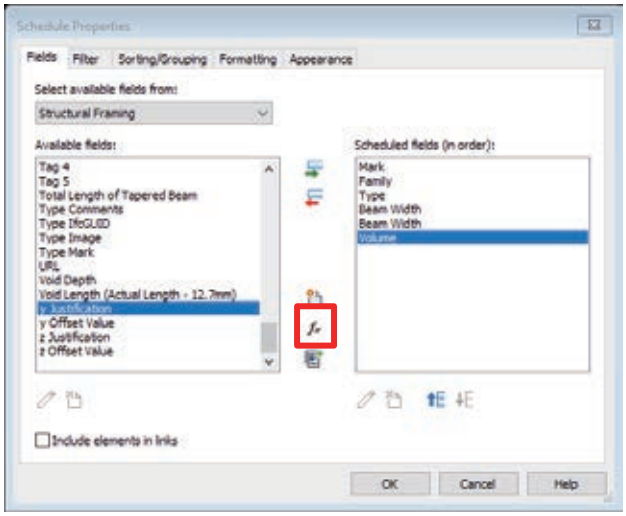


D. Create calculated value:

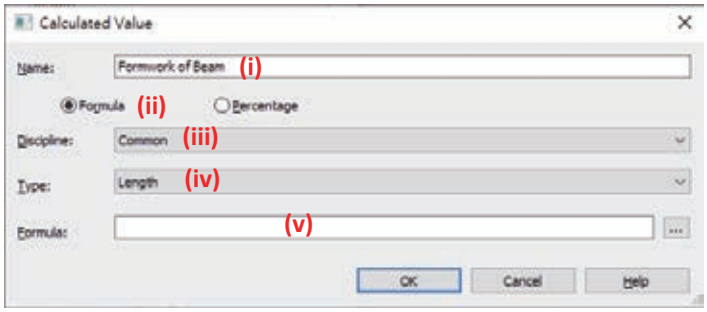
In the schedule, parameters can be created with setting formula. To set up the formula, required parameters have to be selected to the "**Scheduled fields**" column.

e.g., Create "**Formwork of Beam**" by setting formula "**Cut Length * (Beam Width + Beam Depth * 2 – [q Slab Thickness (1)] – [q Slab Thickness (2)])**". "q" is a prefix to denote a parameter set by QS.

a. Click "**Add calculated parameter**"  :



b. Complete the information of "**Calculated Value**":



(i) Input the new name of the parameter, e.g., "**Formwork of Beam**".

(ii) Click **Formula**  .

(iii) Choose the suitable discipline, e.g., Select "**Common**":

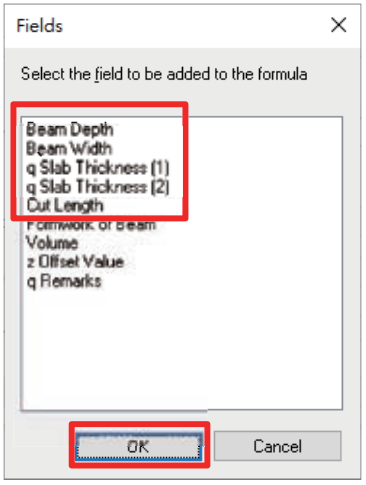
(iv) Choose the suitable type, e.g., Select "**Length**":

(v) Input Formula:

- Click the button ...:

- Select the required fields for formula set up. Only the fields added to the scheduled fields can be selected for creating formula.

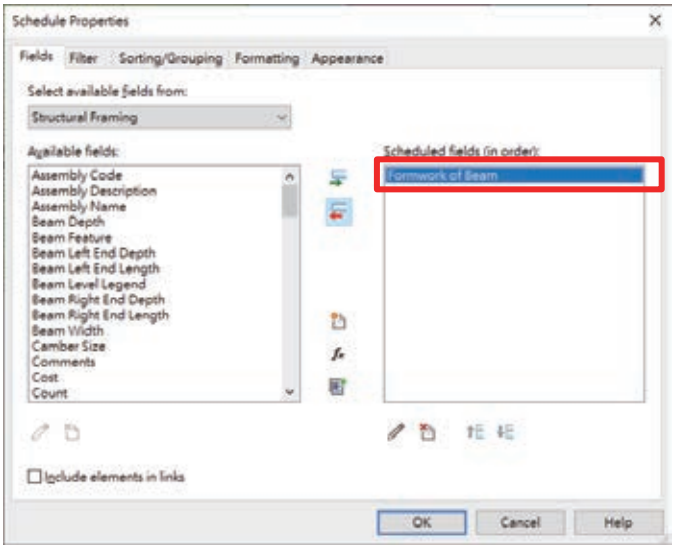
  e.g., Select "**Beam Depth**", "**Beam Width**", "**q Slab Thickness (1)**", "**q Slab Thickness (2)**" and "**Cut Length**".



- Add corresponding **symbol(s)** e.g., "*****", "**+**", "**-**", to the appropriate positions:

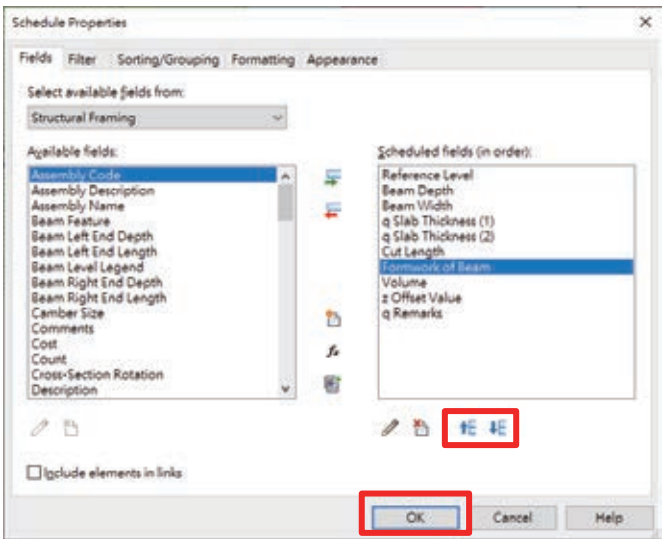
- Once the formula set-up is completed, click "**OK**" of the Calculated Value.

- The new parameter "**Formwork of Beam**" is created and shown in the scheduled fields:



E. Change order of selected fields:

The order of parameters shown in the schedule is based on the order in the scheduled fields. To change the order of selected fields, one can use "↑E" and "↓E" for movement. e.g., select "**Formwork to Beam**" and move it to above "**Volume**":



F. To complete the selection of fields, click "**OK**".

27.1.4 The new schedule, e.g., "Structural Framing Schedule" is created:

<Structural Framing Schedule>

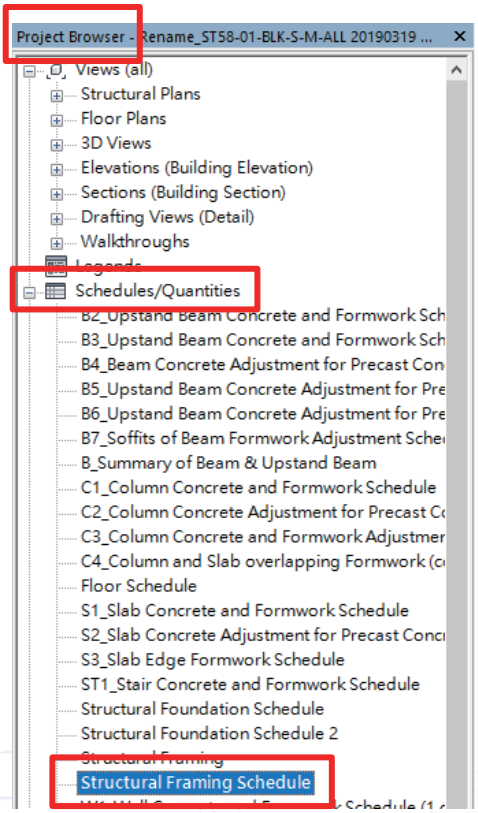
A	B	C	D	E	F	G	H
Reference Level	Beam Depth	Beam Width	g Slab Thickness (1)	g Slab Thickness (2)	Cut Length	Formwork of Beam (m2)	Volume (m3)
9/F_Typ. 1	400.00	300.00	160.00	160.00	1615.00	1.260	0.194
9/F_Typ. 1	400.00	300.00	160.00	160.00	1615.00	1.260	0.194
9/F_Typ. 1	400.00	250.00	160.00	160.00	1615.00	1.179	0.162
9/F_Typ. 1	400.00	300.00	160.00	0.00	500.00	0.470	0.060
9/F_Typ. 1	400.00	300.00	160.00	0.00	500.00	0.470	0.060
9/F_Typ. 1	500.00	300.00	350.00	0.00	1850.00	1.758	0.278
9/F_Typ. 1	400.00	200.00	350.00	0.00	700.00	0.455	0.056
9/F_Typ. 1	400.00	250.00	160.00	160.00	1615.00	1.179	0.162
9/F_Typ. 1	400.00	250.00	160.00	160.00	1615.00	1.179	0.162
9/F_Typ. 1	350.00	200.00	350.00	0.00	4730.00	2.602	0.331
9/F_Typ. 1	350.00	200.00	350.00	0.00	5600.00	3.080	0.392
9/F_Typ. 1	350.00	200.00	0.00	0.00	2365.00	2.129	0.166
9/F_Typ. 1	350.00	200.00	0.00	0.00	2365.00	2.129	0.166
9/F_Typ. 1	500.00	250.00	350.00	200.00	2600.00	1.820	0.325
9/F_Typ. 1	500.00	400.00	350.00	0.00	1530.00	1.607	0.306
9/F_Typ. 1	400.00	250.00	350.00	0.00	800.00	0.560	0.080
9/F_Typ. 1	500.00	400.00	350.00	0.00	2855.00	2.998	0.571
9/F_Typ. 1	400.00	250.00	160.00	160.00	1615.00	1.179	0.162
9/F_Typ. 1	400.00	300.00	350.00	0.00	700.00	0.525	0.084
9/F_Typ. 1	400.00	250.00	350.00	0.00	800.00	0.560	0.080
9/F_Typ. 1: 20						28.395	3.987

27.1.5 Rename schedules:

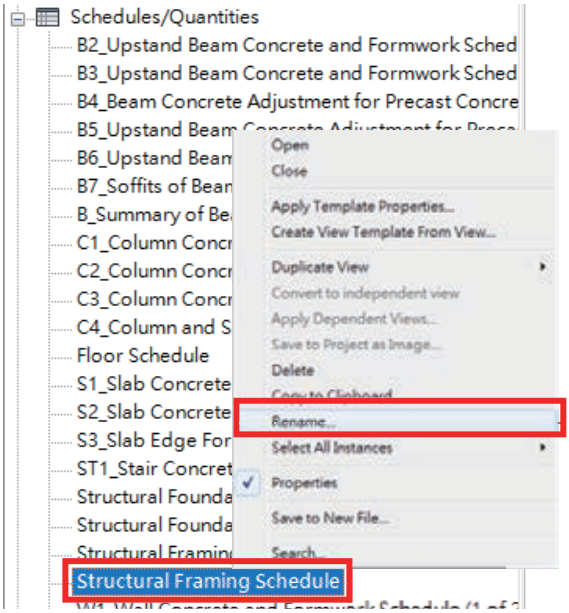
The original naming of schedules is based on its category. After a schedule is created, the name of schedule can be changed for specific usage.

A. Select the new created schedule in the Project Browser:

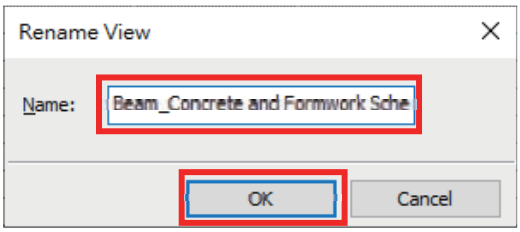
- "**Project Browser**" > "**Schedules/Quantities**" > "**Structural Framing Schedule**":



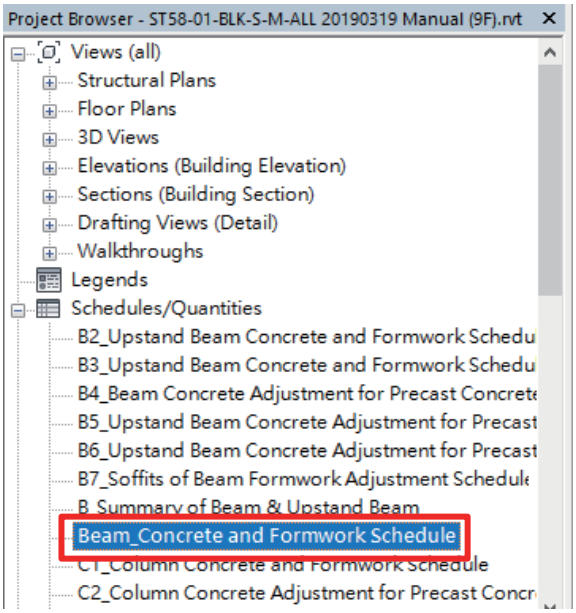
B. Right-click the rename button and select "**Rename…**":



C. **Rename** the schedule (e.g., rename to "**Beam_Concrete and Formwork Schedule**") > "**OK**".



The schedule is renamed to "**Beam_Concrete and Formwork Schedule**":

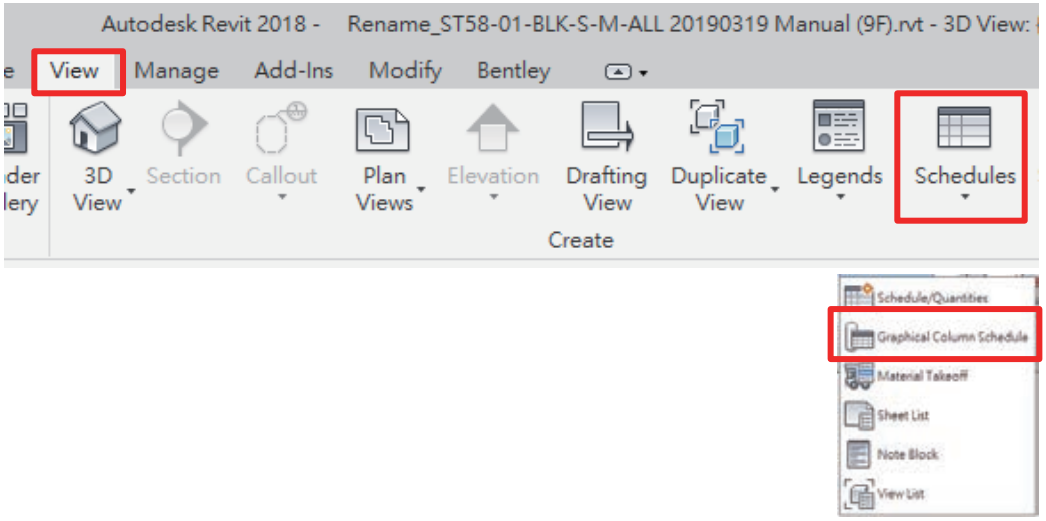


<Beam_Concrete and Formwork Schedule>

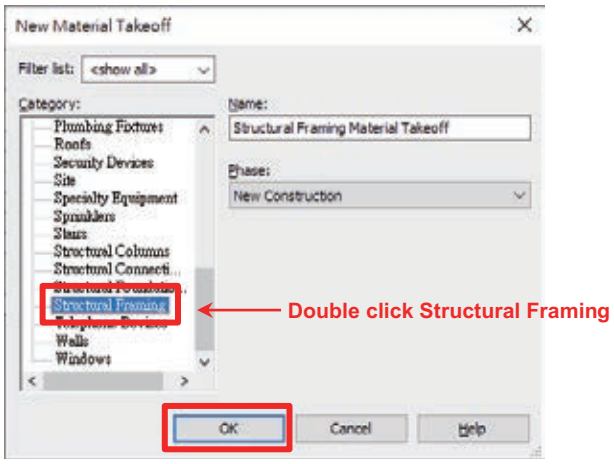
A	B	C	D	E	F	G	H
Reference Level	Beam Depth	Beam Width	q Slab Thickness (1)	q Slab Thickness (2)	Cut Length	Formwork of Beam (m2)	Volume (m3)
9/F_Typ. 1	400.00	300.00	160.00	160.00	1615.00	1.260	0.194
9/F_Typ. 1	400.00	300.00	160.00	160.00	1615.00	1.260	0.194
9/F_Typ. 1	400.00	250.00	160.00	160.00	1615.00	1.179	0.162
9/F_Typ. 1	400.00	300.00	160.00	0.00	500.00	0.470	0.060
9/F_Typ. 1	400.00	300.00	160.00	0.00	500.00	0.470	0.060
9/F_Typ. 1	500.00	300.00	350.00	0.00	1850.00	1.768	0.278
9/F_Typ. 1	400.00	200.00	350.00	0.00	700.00	0.455	0.056
9/F_Typ. 1	400.00	250.00	160.00	160.00	1615.00	1.179	0.162
9/F_Typ. 1	400.00	250.00	160.00	160.00	1615.00	1.179	0.162
9/F_Typ. 1	350.00	200.00	350.00	0.00	4730.00	2.602	0.331
9/F_Typ. 1	350.00	200.00	350.00	0.00	5600.00	3.080	0.392
9/F_Typ. 1	350.00	200.00	0.00	0.00	2365.00	2.129	0.166
9/F_Typ. 1	350.00	200.00	0.00	0.00	2365.00	2.129	0.166
9/F_Typ. 1	500.00	250.00	350.00	200.00	2600.00	1.820	0.325
9/F_Typ. 1	500.00	400.00	350.00	0.00	1530.00	1.607	0.306
9/F_Typ. 1	400.00	250.00	350.00	0.00	800.00	0.560	0.080
9/F_Typ. 1	500.00	400.00	350.00	0.00	2855.00	2.998	0.571
9/F_Typ. 1	400.00	250.00	160.00	160.00	1615.00	1.179	0.162
9/F_Typ. 1	400.00	300.00	350.00	0.00	700.00	0.525	0.084
9/F_Typ. 1	400.00	250.00	350.00	0.00	800.00	0.560	0.080
9/F_Typ. 1: 20						28.395	3.987

27.2 CREATE MATERIAL TAKE-OFF SCHEDULES

27.2.1 Click "**View**" > "**Schedules**" > "**Material Take-off**":



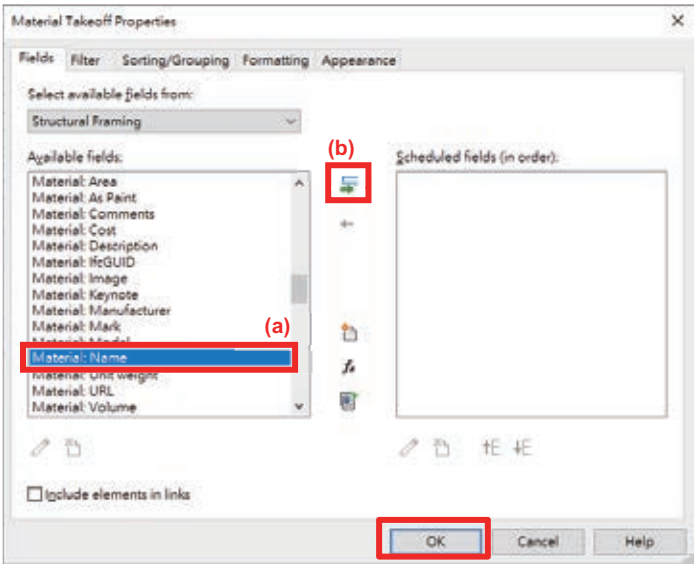
27.2.2 Select the required category of the new Material Take-off, e.g., Select "**Structural Framing**":



27.2.3 Select available fields to be included in the Material Take-off Schedule:

Add the required parameters from "**Available fields**" column to "**Scheduled fields**" column. At least one material field must be selected to Material Take-off Schedule, e.g., Material: Name/Material: Area.

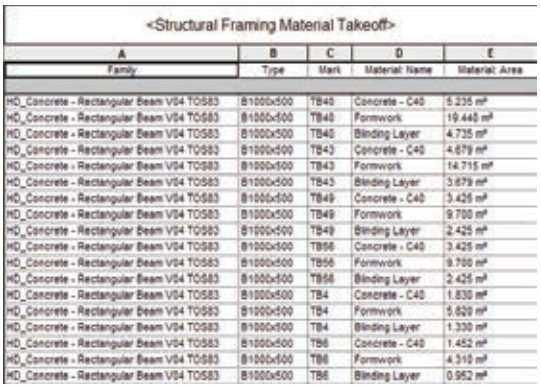
Double click the selected parameter in the "**Available fields**" column, or click the selected parameter in the "**Available fields**" column and click the button:



Refer to Section 27.1.3 for details of selecting available fields, adding new parameters and Calculated Value with formula.

After added/created the required parameters, click "**OK**".

27.2.4 The new Material Take-off Schedule is created:



27.2.5 Rename Material Take-off Schedules:

The Material Take-off Schedule can be renamed for specific usage. Refer to Section 27.1.5 for details.

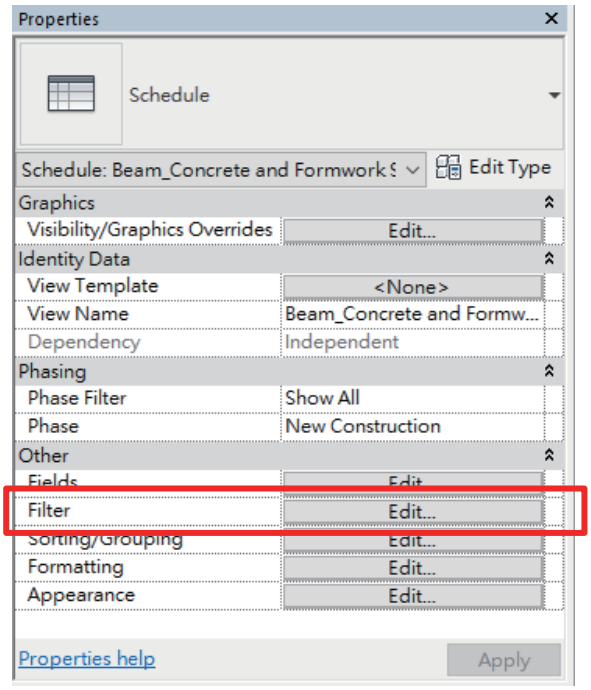
27.3 FUNCTIONS OF SCHEDULES/MATERIAL TAKE-OFF SCHEDULES

27.3.1 Use "Filter" of Schedules:

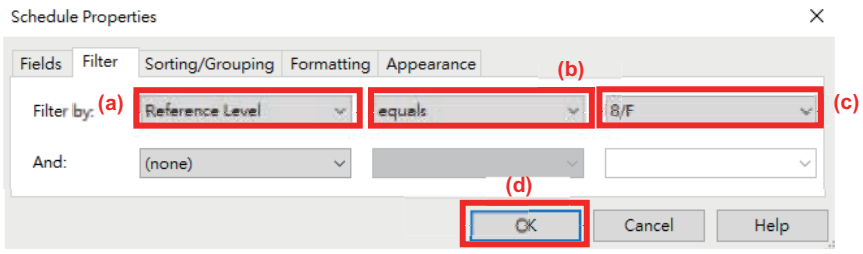
Filter can be used to sort out the elements with specific parameters/requirements.

A. Select the desired schedule in project browser and open the schedule.

B. Click the "**Edit**" button against **Filter** in the Properties pallet of Schedule:



C. Set the filter requirements for parameters in the schedule:



a. Filter by "**Reference Level**".
b. Select "**equals**".
c. Select "**8/F**".
d. "**OK**".

The schedule is filtered by "**Reference Level – 8/F**":

<Beam_Concrete and Formwork Schedule>

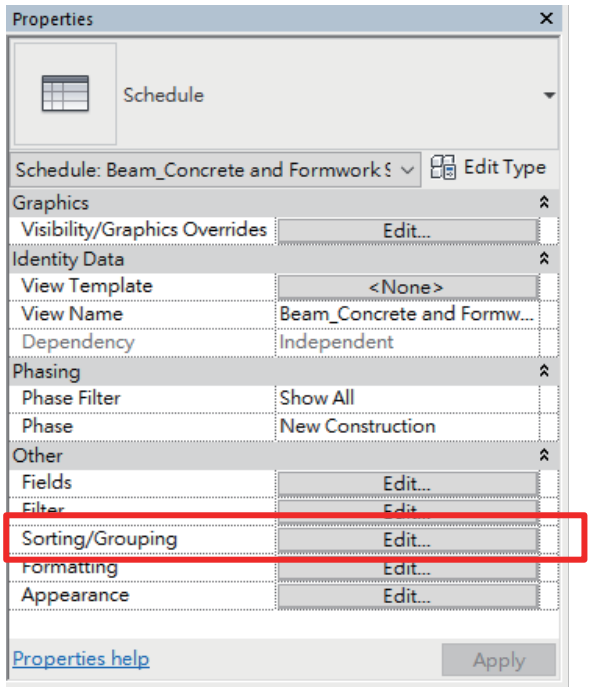
A	B	C	D	E	F	G	H
Reference Level	Beam Depth	Beam Width	g Slab Thickness (1)	g Slab Thickness (2)	Cut Length	Formwork of Beam (m2)	Volume (m3)
8/F	400.00	350.00			1815.00		0.194
8/F	400.00	300.00			1815.00		0.194
8/F	1130.00	250.00			515.00		0.171
8/F	1130.00	250.00			515.00		0.171
8/F	1130.00	250.00			515.00		0.171
8/F	1120.00	250.00			500.00		0.153
8/F	1130.00	250.00			515.00		0.171
8/F	1120.00	250.00			500.00		0.153
8/F	400.00	250.00			1815.00		0.162
8/F	400.00	250.00			1850.00		0.185
8/F	400.00	250.00			1850.00		0.185
8/F	400.00	250.00			1850.00		0.185
8/F	400.00	250.00			1850.00		0.185
8/F	400.00	300.00			500.00		0.060
8/F	400.00	300.00			500.00		0.060

27.3.2 Use "Sorting/Grouping" of Schedules:

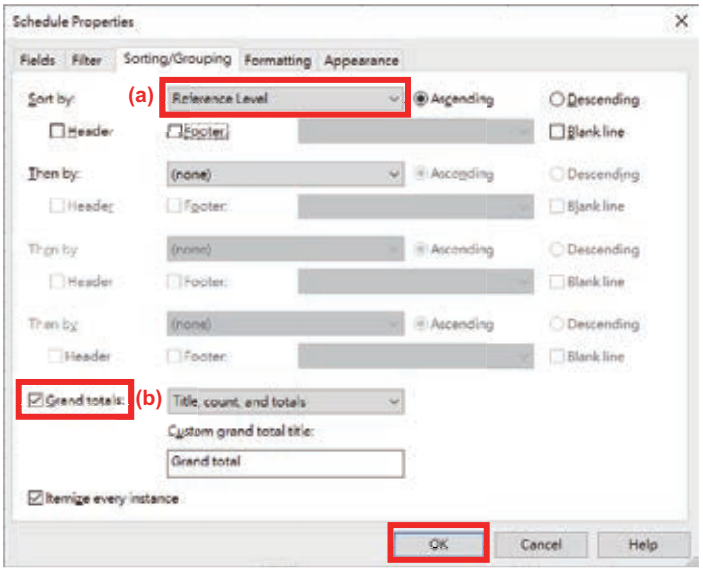
Sorting/Grouping can be used to sort/group the elements by the selected parameters:

A. Select the desired schedule in project browser and open the schedule.

B. Click the "**Edit**" button under **Sorting/Grouping** in the Properties pallet of Schedule:



C. Select a field for sorting/grouping (e.g., sort by "**Reference Level**" and calculate the total no. of elements):



a. Sort by: "**Reference Level**" (*for sorting*).

b. Tick "**Grand totals**:" (*for grouping*) > click "**OK**".

D. The schedule is sorted by "**Reference Level**" and the total number of elements is shown at the bottom:

<Beam_Concrete and Formwork Schedule>

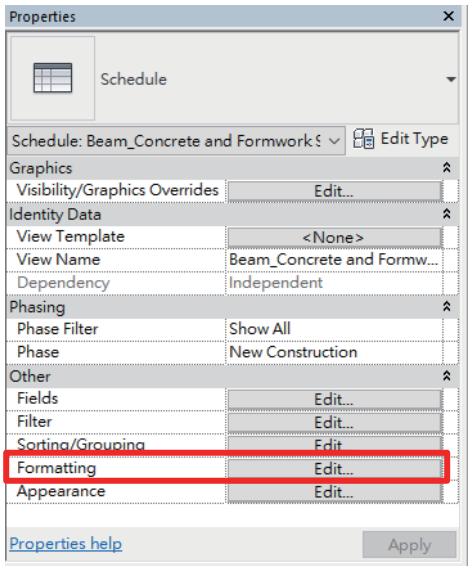
A	B	C	D	E	F	G	H
Reference Level	Beam Depth	Beam Width	g Slab Thickness (1)	g Slab Thickness (2)	Cut Length	Formwork of Beam (m2)	Volume (m3)
B/F	400.00	300.00			1615.00		0.194
B/F	400.00	300.00			1615.00		0.194
B/F	1330.00	250.00			515.00		0.171
B/F	1330.00	250.00			515.00		0.171
B/F	400.00	250.00			2015.00		0.232
B/F	400.00	250.00			2015.00		0.232
B/F	400.00	250.00			2015.00		0.232
B/F	400.00	250.00			2015.00		0.232
Grand total: 76						0.000	17.453

27.3.3 Use "Formatting" of Schedules:

Formatting can be used to set specific format/setting to the schedule:

A. Select the desired schedule in project browser and open the schedule.

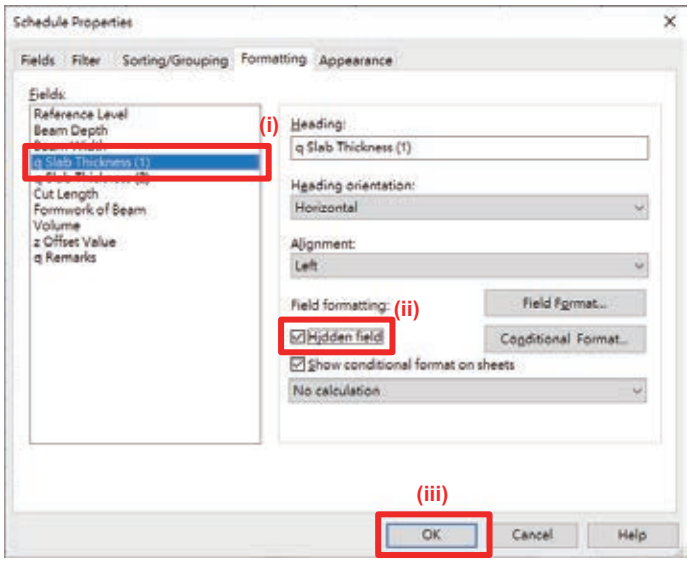
B. Click the "**Edit**" button under **Formatting** in the Properties pallet of Schedule:



C. Format the schedules:

a. Hide unwanted field:

(e.g., fields used for creating formula only):



(i) Select the **unwanted field** (e.g., "**q Slab Thickness (1)**").

(ii) Tick the box "**Hidden field**".

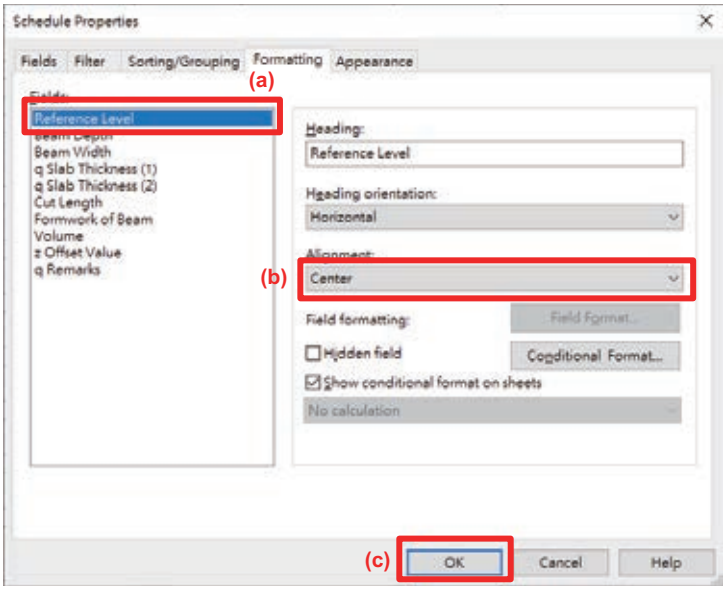
(iii) "**OK**".

The selected field "**q Slab Thickness (1)**" will not show in the schedule:

<Beam_Concrete and Formwork Schedule>

A	B	C	D	E	F	G
Reference Level	Beam Depth	Beam Width	q Slab Thickness (2)	Cut Length	Formwork of Beam (m2)	Volume (m3)
8/F	400.00	300.00		1615.00		0.194
8/F	400.00	300.00		1615.00		0.194
8/F	1330.00	250.00		515.00		0.171
8/F	1330.00	250.00		515.00		0.171
8/F	1330.00	250.00		515.00		0.171
8/F	1220.00	250.00		500.00		0.153
8/F	1330.00	250.00		515.00		0.171
8/F	1220.00	250.00		500.00		0.153

b. Align the field to center:



(i) Select the **field(s)** to be aligned (e.g., "**Reference Level**").

(ii) Select "**Center**" under Alignment.

(iii) "**OK**".

The "**Reference Level**" is aligned to "center":

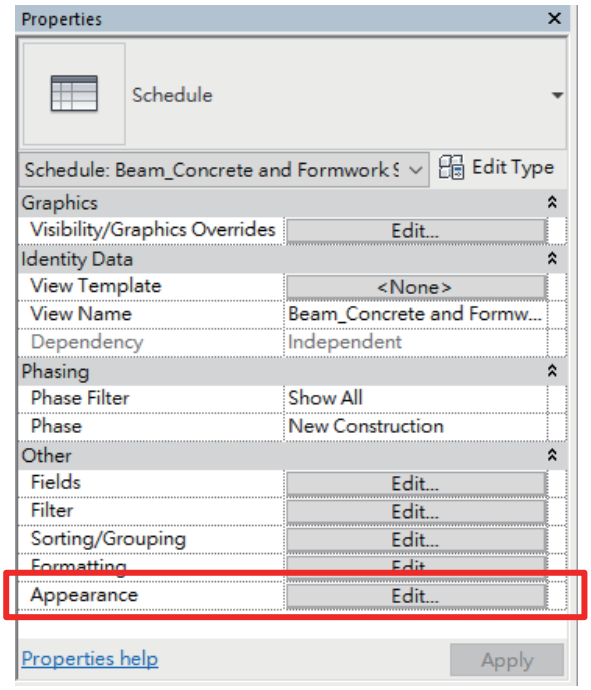
<Beam_Concrete and Formwork Schedule>

A	B	C	D	E	F	G
Reference Level	Beam Depth	Beam Width	q Slab Thickness (2)	Cut Length	Formwork of Beam (m2)	Volume (m3)
B/F	400.00	300.00		1615.00		0.194
B/F	400.00	300.00		1615.00		0.194
B/F	1330.00	250.00		515.00		0.171
B/F	1330.00	250.00		515.00		0.171
B/F	1330.00	250.00		515.00		0.171
B/F	1220.00	250.00		500.00		0.153
B/F	1330.00	250.00		515.00		0.171
B/F	1220.00	250.00		500.00		0.153

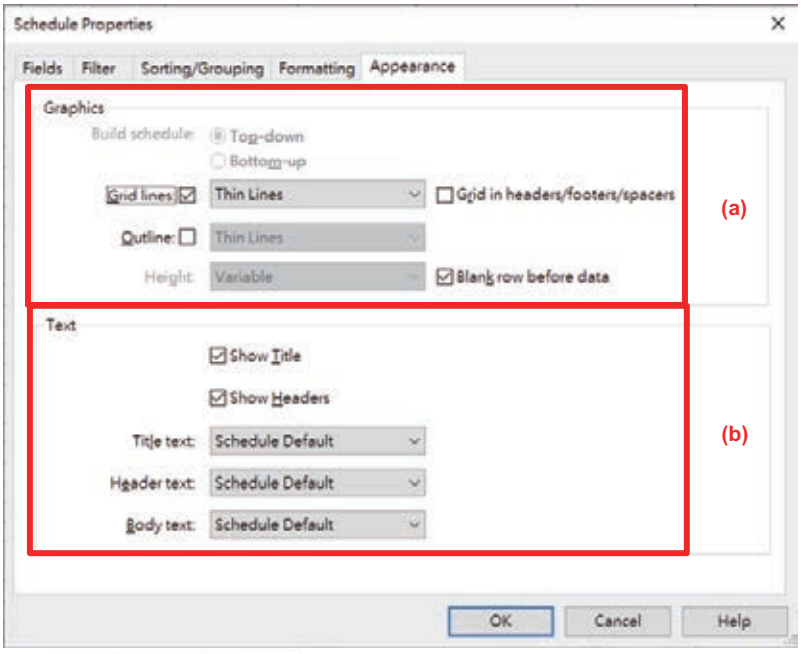
27.3.4 Use "Appearance" of Schedules:

A. Select the desired schedule in project browser and open the schedule.

B. Click the "**Edit**" button under **Appearance** in the Properties pallet of Schedule:



C. Select appropriate appearance for the Schedules/Material Take-off Schedules:



(i) Select the style of grid line/outline.

(ii) Select the text style for the title, header and body.

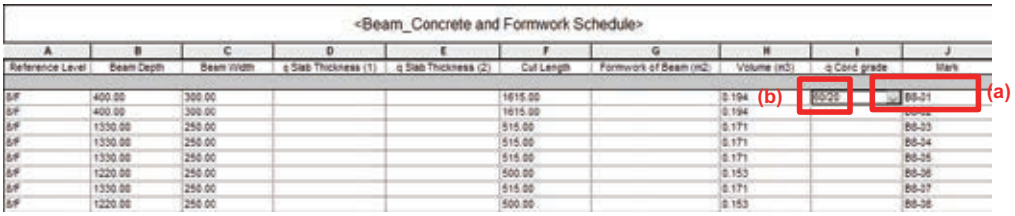
27.4 ADD DATA INFORMATION IN THE SCHEDULES

27.4.1 Add parameters to Individual Element:

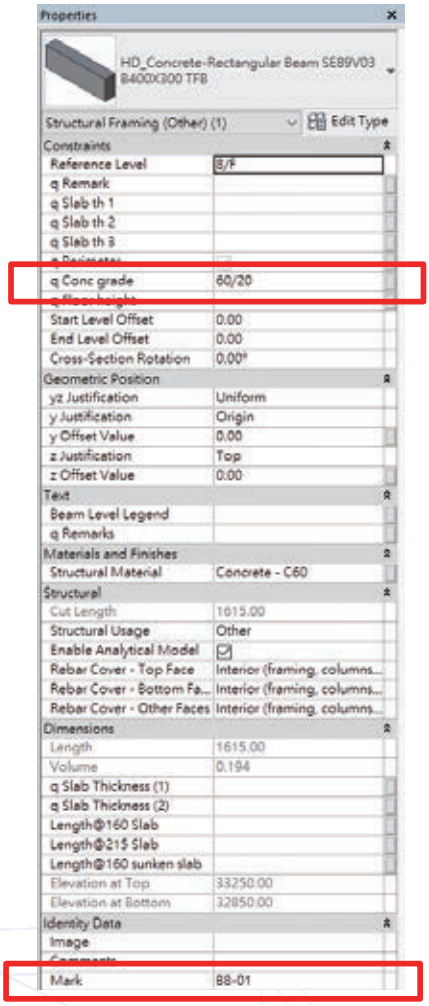
Once the information of parameters is added in the schedule, the relevant fields shown in the Properties pallet will be updated, e.g., add "**Conc grade 60/20**" for beam mark B8-01.

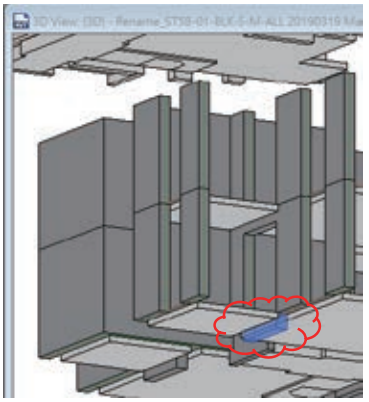
A. Click the beam Mark B8-01 in schedule.

B. **Type** "**60/20**" under parameter "**q Conc grade**":



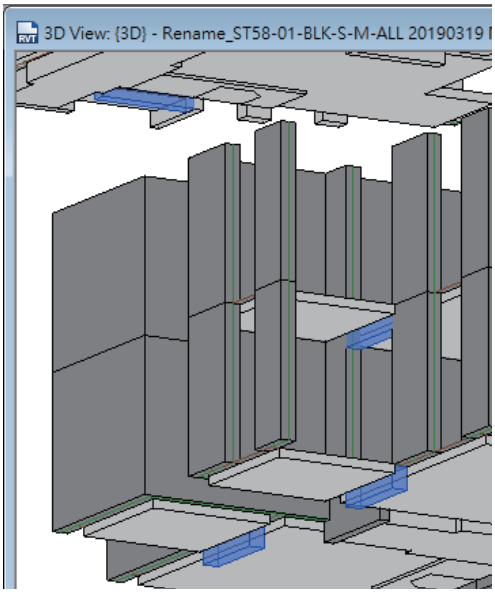
The information of the parameter is updated to the Properties pallet automatically. Such kind of adding information in models by QS should be done in the models for QTO only.



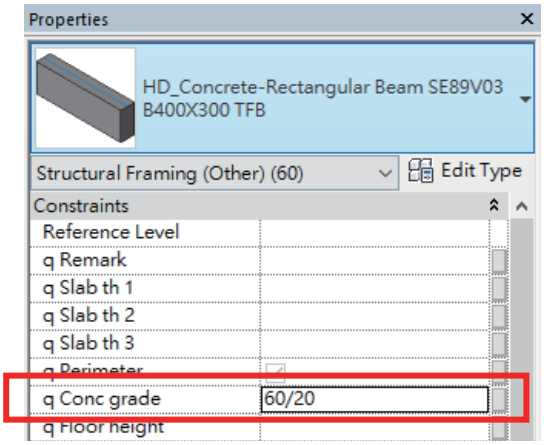


27.4.2 Add parameters to a Group of Element/Category:

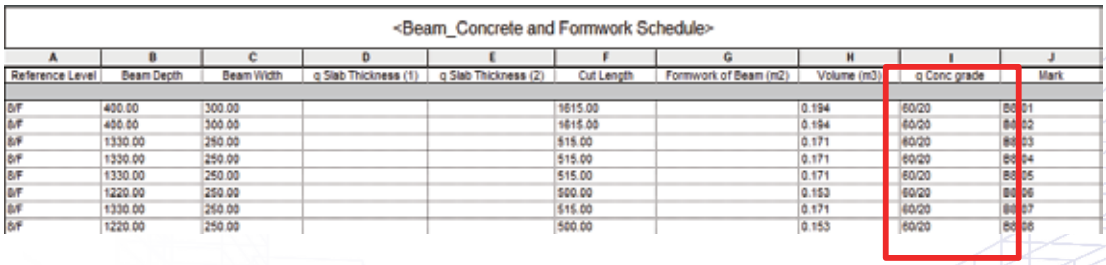
A. Select a beam and use short cut key "**SA**" to select all instances of beam:



B. Add Concrete grade "**60/20**" under parameter "**q Conc grade**" in the Properties:



The information under parameter "**q Conc grade**" will be updated automatically in the existing schedule:



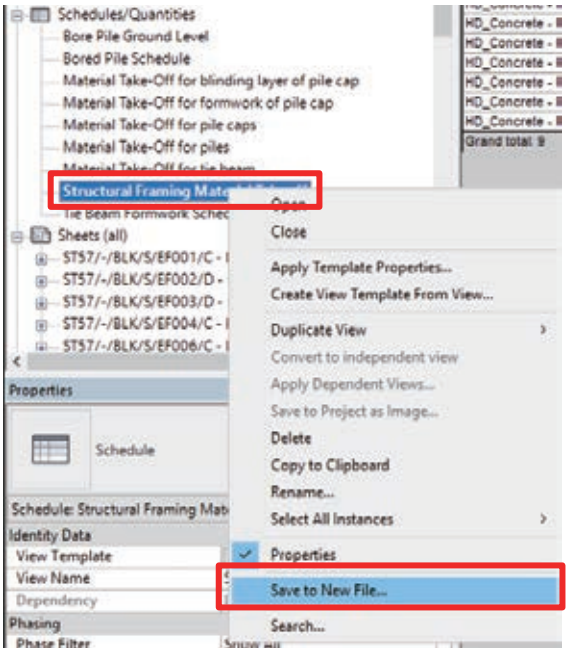
27.5 GENERATE SCHEDULE TEMPLATES

27.5.1 Once the schedules are created and developed, they can be saved as **template and copied** to other projects.

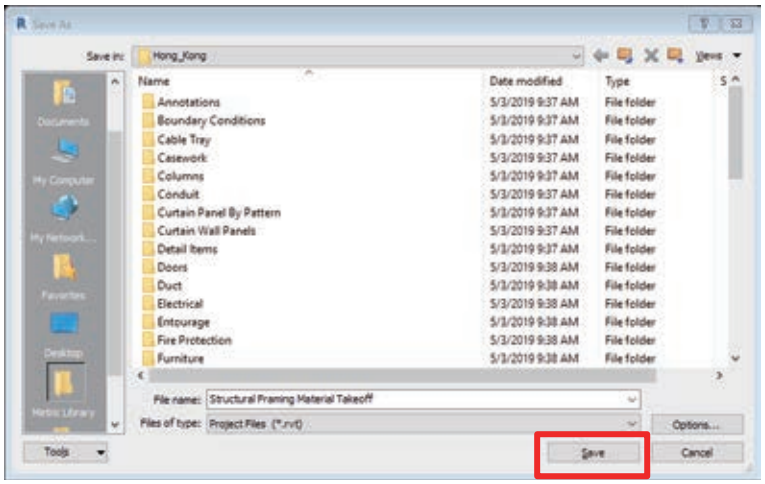
27.5.2 Select the **desired schedules** in existing project.

- "**Project Browser**" > "**Schedules/Quantities**" > Desired Schedule (e.g., "**Structural Framing Material Take-off Schedule**").

27.5.3 Save the schedule by right-click mouse and select "**Save to New File...**":



27.5.4 Select the **desired location** to save:

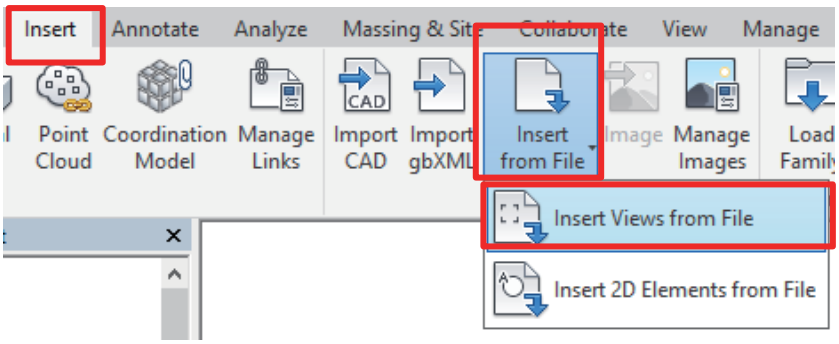


27.6 COPY SCHEDULES

27.6.1 There are three options for copying schedules from template or project. Once the schedules/schedule templates are copied to the new project, the information shown in the schedule will be updated automatically based on the new project.

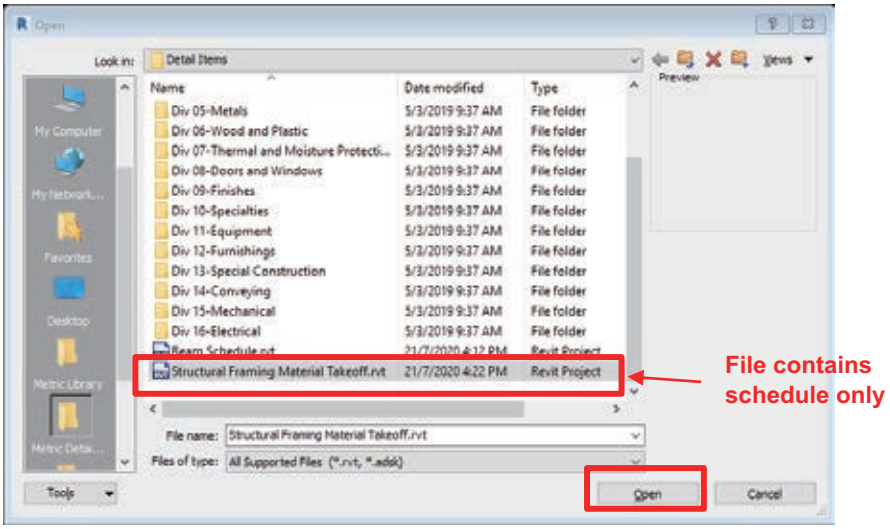
27.6.2 Insert schedules from template (Option 1):

A. "**Insert**" > "**Insert from File**" > "**Insert Views from File**":

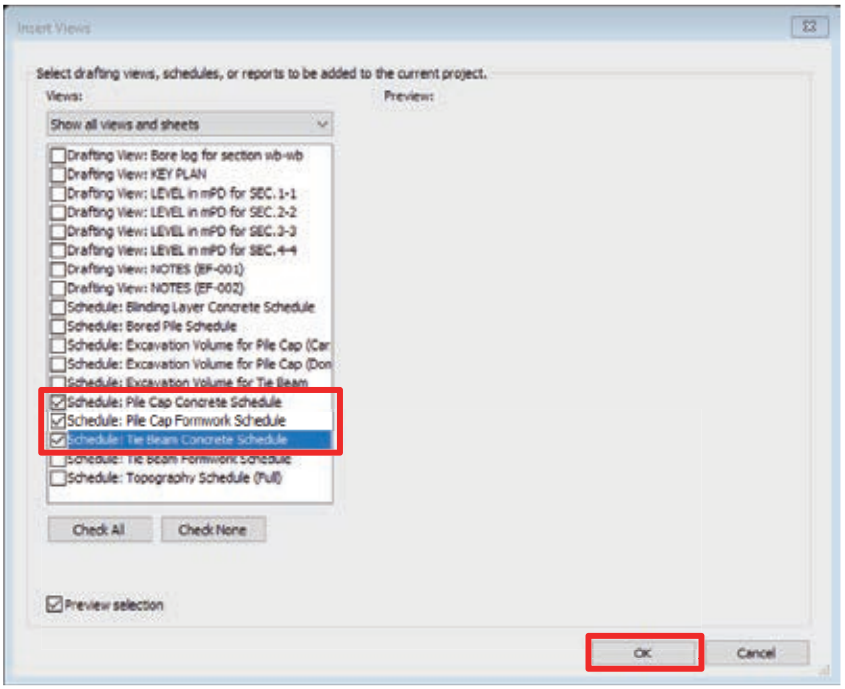


B. Select the schedule template:

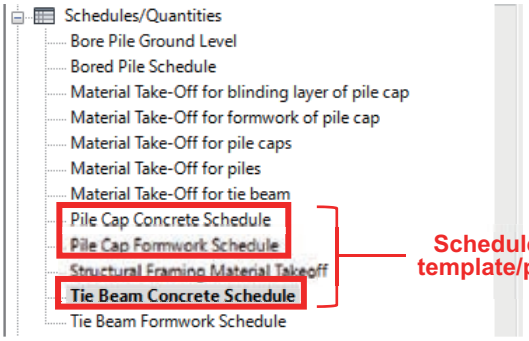
Select the **saved template** > "**Open**":

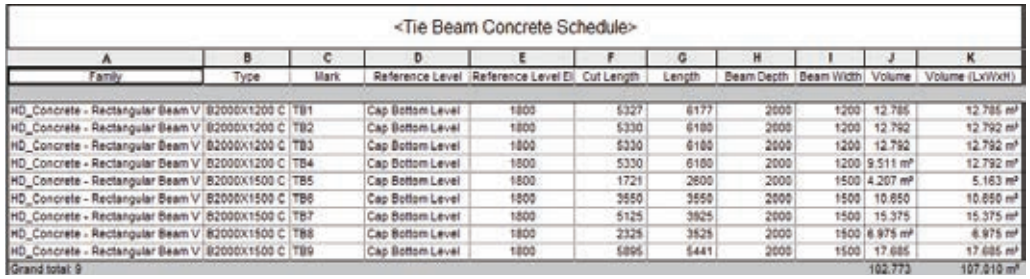


C. **Select and tick the previous schedules** to copy to the new project > "**OK**":



The selected schedules have been copied to the new project:





<Tie Beam Concrete Schedule>

A	B	C	D	E	F	G	H	I	J	K
Family	Type	Mark	Reference Level	Reference Level El	Cut Length	Length	Beam Depth	Beam Width	Volume	Volume (LxWxH)

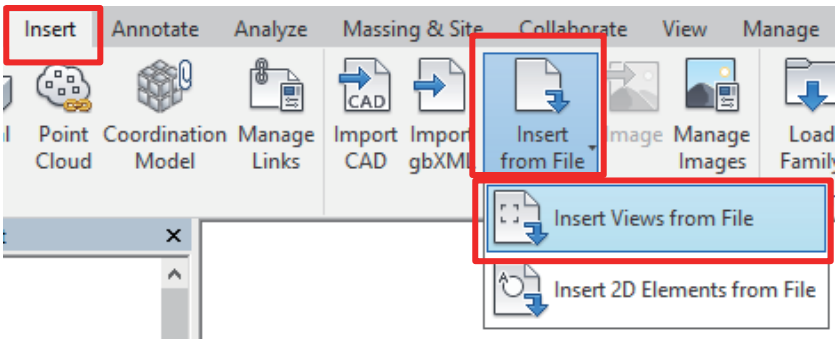
Grand total: 9									102.773	107.010 m³

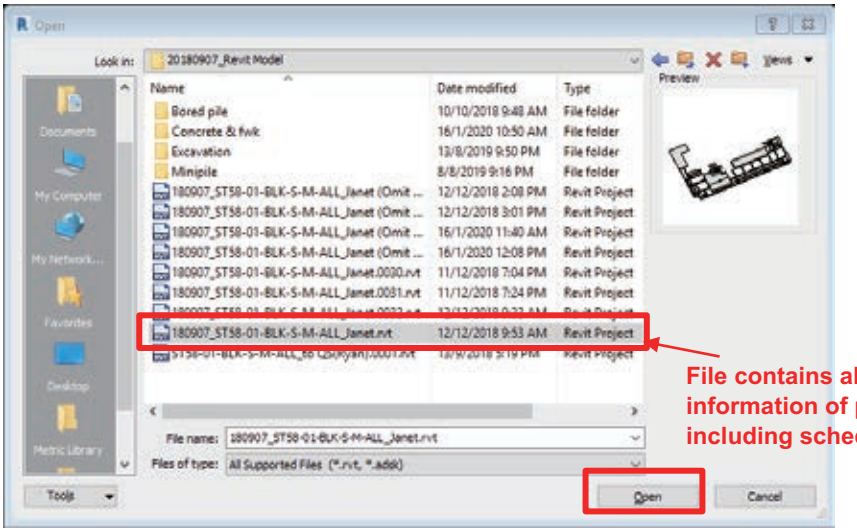
27.6.3 Insert schedules from previous project: (Option 2)

A. "**Insert**" > "**Insert from File**" > "**Insert Views from File**".

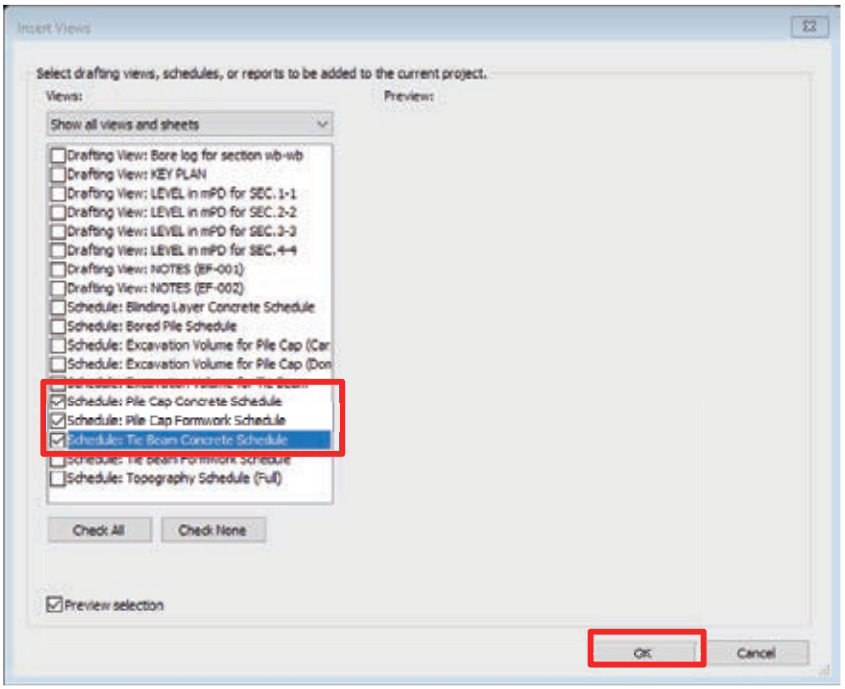


B. Select the previous project:

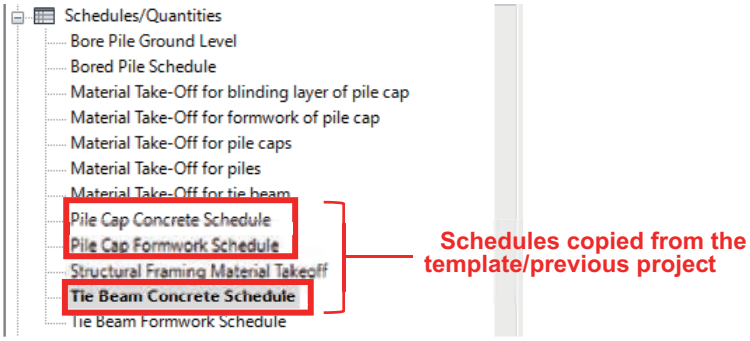
Select the **saved previous project** > "**Open**":



C. **Select and tick the previous schedules** to copy to the new project > "**OK**":



The selected schedules have been copied to the new project.



<Tie Beam Concrete Schedule>

A	B	C	D	E	F	G	H	I	J	K
Family	Type	Mark	Reference Level	Reference Level El	Cut Length	Length	Beam Depth	Beam Width	Volume	Volume (LxWxH)
HD_Concrete - Rectangular Beam V	B2000X1200 C	TB1	Cap Bottom Level	1800	5327	6177	2000	1200	12.785 m³	12.785 m³
HD_Concrete - Rectangular Beam V	B2000X1200 C	TB2	Cap Bottom Level	1800	5330	6180	2000	1200	12.792 m³	12.792 m³

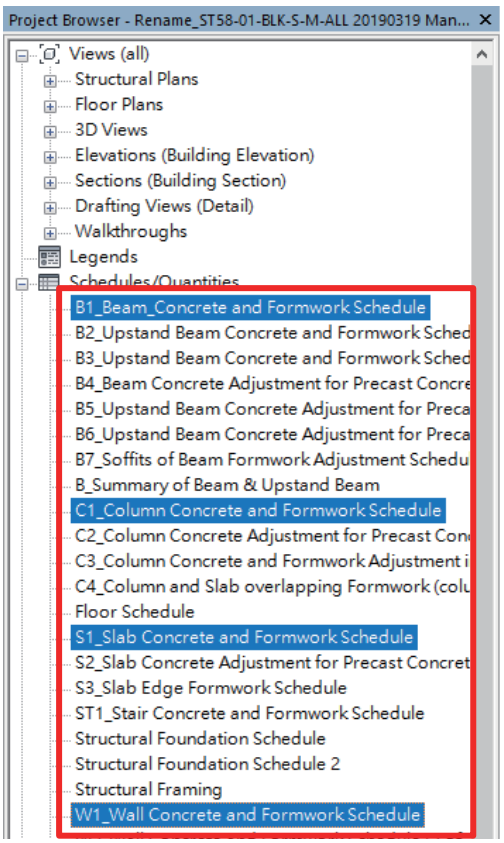
HD_Concrete - Rectangular Beam V	B2000X1500 C	TB8	Cap Bottom Level	1800	2325	3525	2000	1500	6.975 m³	6.975 m³
HD_Concrete - Rectangular Beam V	B2000X1500 C	TB9	Cap Bottom Level	1800	5895	5441	2000	1500	17.685 m³	17.685 m³
Grand total: 9									102.773	107.010 m³

27.6.4 Copy schedules from previous project (Option 3):

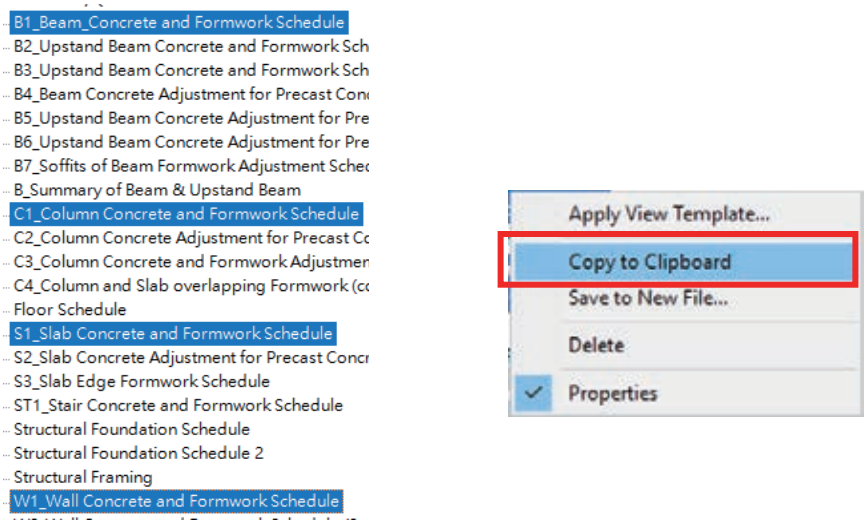
A. **Open** the previous project.

B. Select the required schedule(s) in Project Browser:

e.g., Select schedules named "**B1_Beam_Concrete and Formwork Schedule, C1_Column Concrete and Formwork Schedule, S1_Slab Concrete and Formwork Schedule** and **W1_Wall Concrete and Formwork Schedule**":

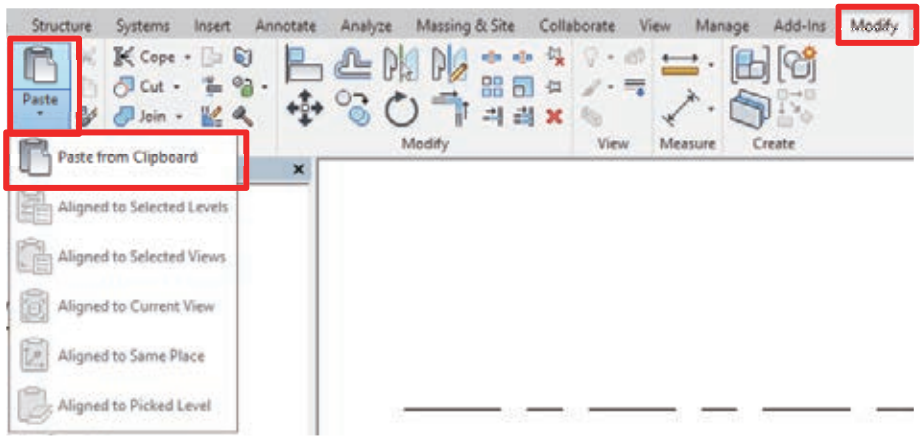


C. Right-click mouse and select "**Copy to Clipboard**":

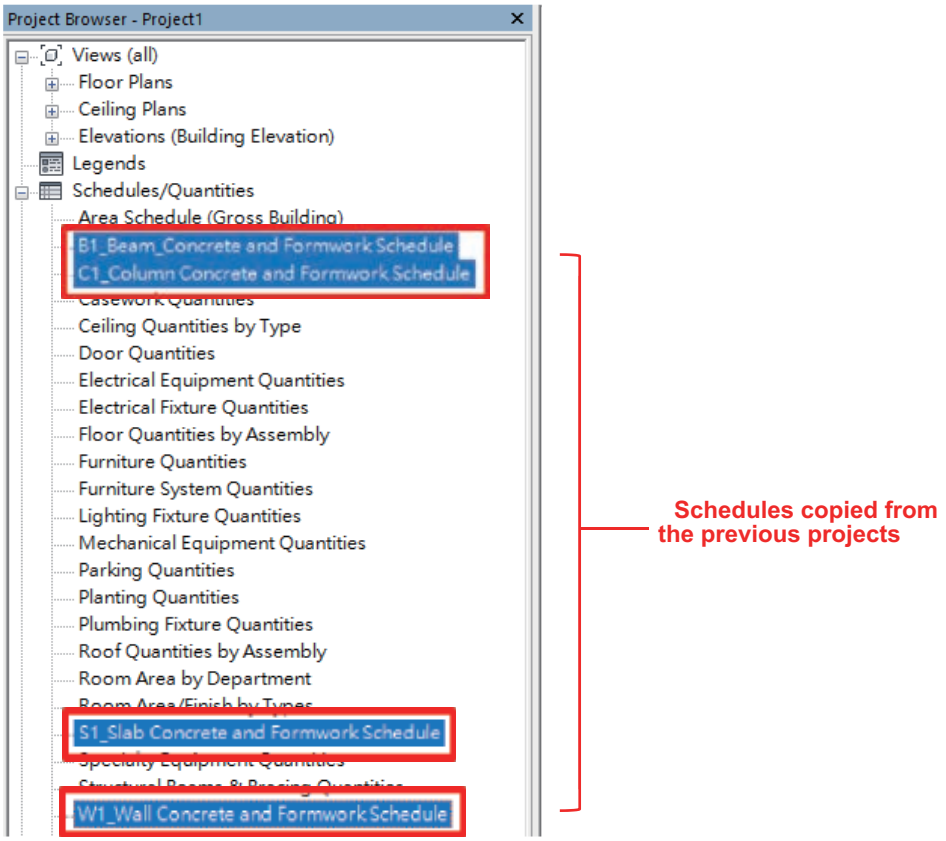


D. **Open** the new project.

E. Paste the copied schedules by "**Modify**" > "**Paste**" > Select "**Paste from Clipboard**":



The schedules have been copied to the new project:



27.7 EXPORT DATA INFORMATION FROM REVIT

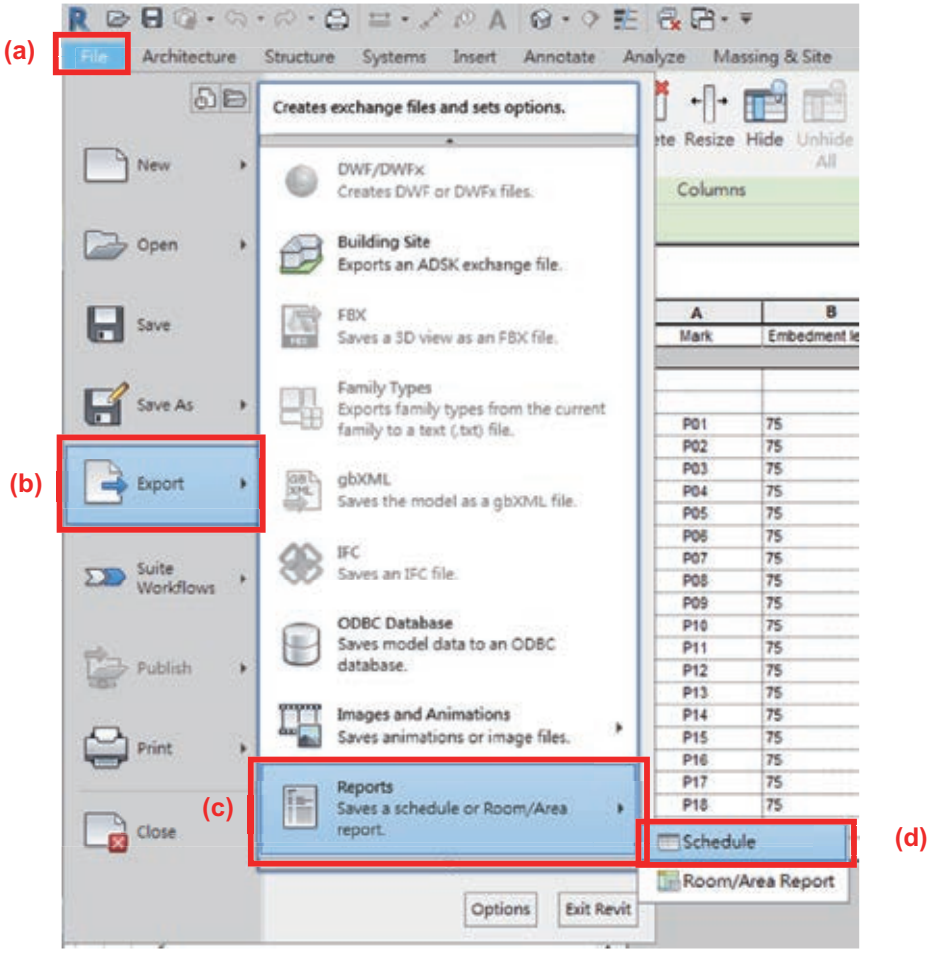
27.7.1 There are two common approaches to extract the data information from Revit to other file types for further processing. The first one is to export the Revit schedules as a CSV file, or a text file and then copy to Excel, and the other one is using a plug-in, such as Dynamo.

27.7.2 Export to Excel file

Once the schedules/material take-off schedules are created in Revit, the information in schedules/material take-off schedules can be **exported as a CSV[#] file and opened in Excel or as a text file and copied to Excel** for further manipulation. However, all formulae created in the schedule cannot be transferred to Excel and all information is displayed as a text only.

[#] *(P.S.: Revit 2022 supports exporting information in schedules as CSV files)*

A. Export the schedule:



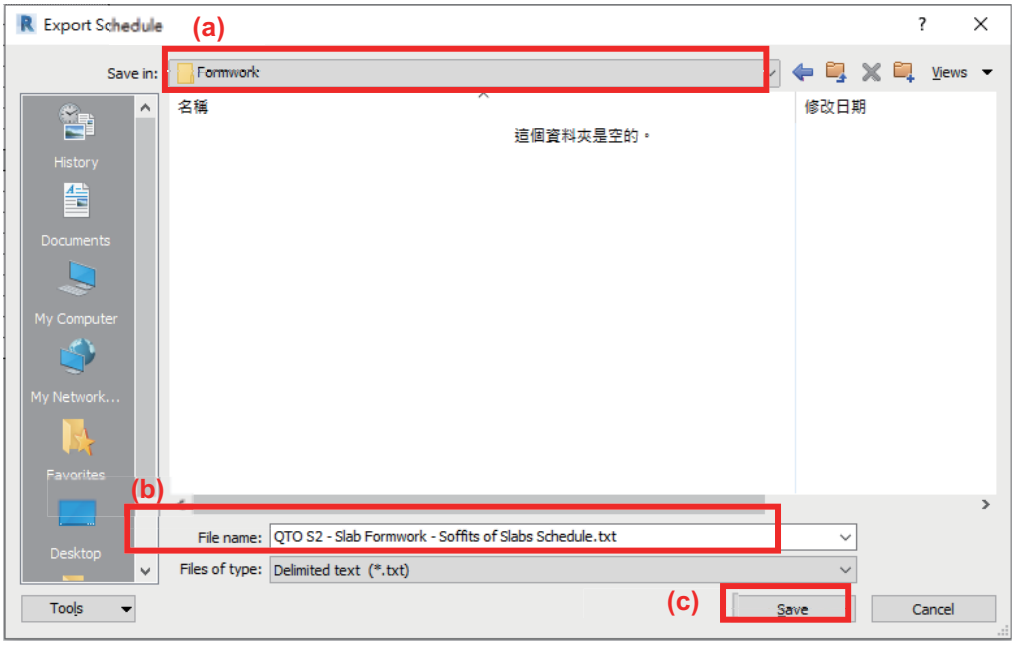
(a) Click File at the top-left corner to open the application menu.

(b) Select Export "**Export**" button.

(c) Select Reports "**Reports**" in ribbon.

(d) Select Schedule "**Schedule**".

B. Save the schedule as .txt file:

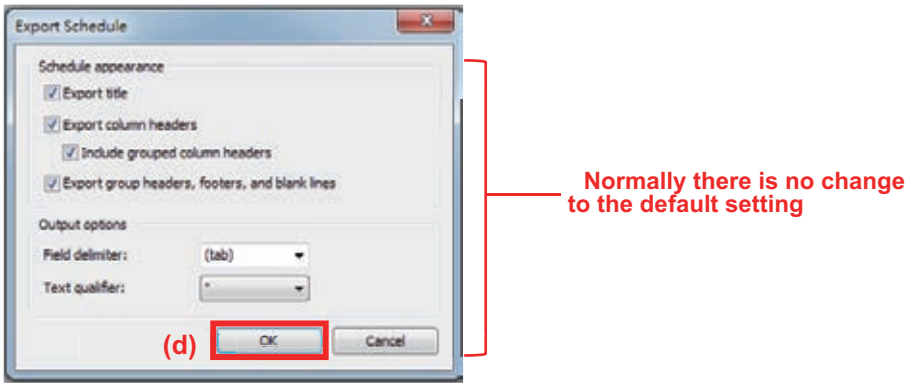


(a) Select the **desired folder**.

(b) Add the file name. The file only can be saved as "txt" format.

(c) Click "**Save**" button.

(d) Another window of "**Export Schedule**" will pop up. Click "**OK**":

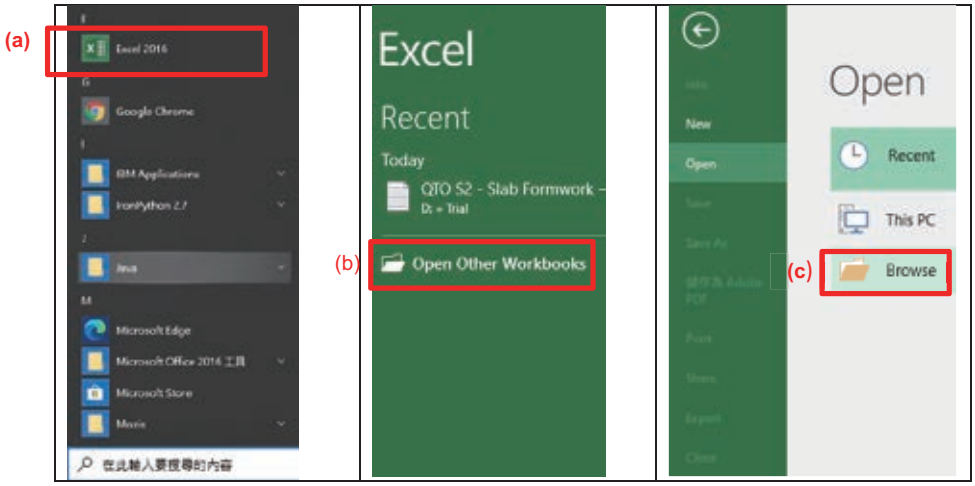


C. Use Excel to open the .txt file:

(a) Open a new **Excel file**.

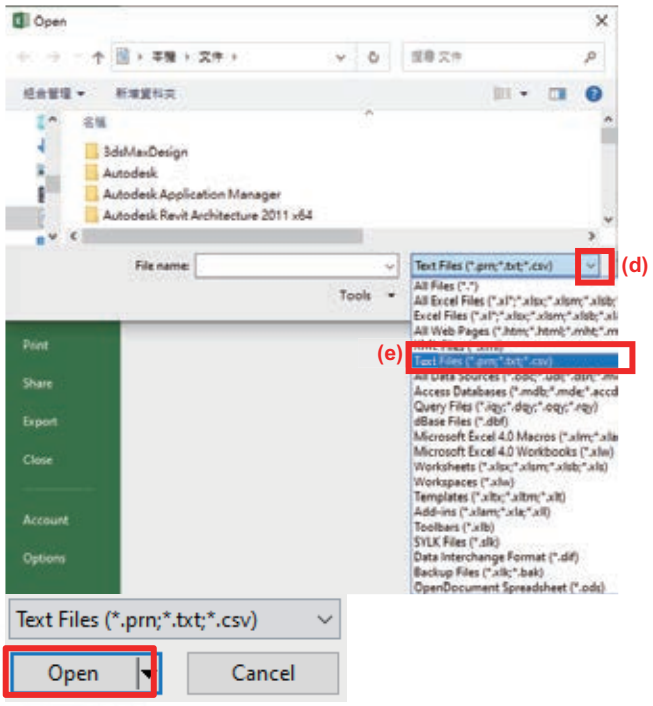
(b) Select "**Open Other Workbooks**".

(c) Select "**Browse**":

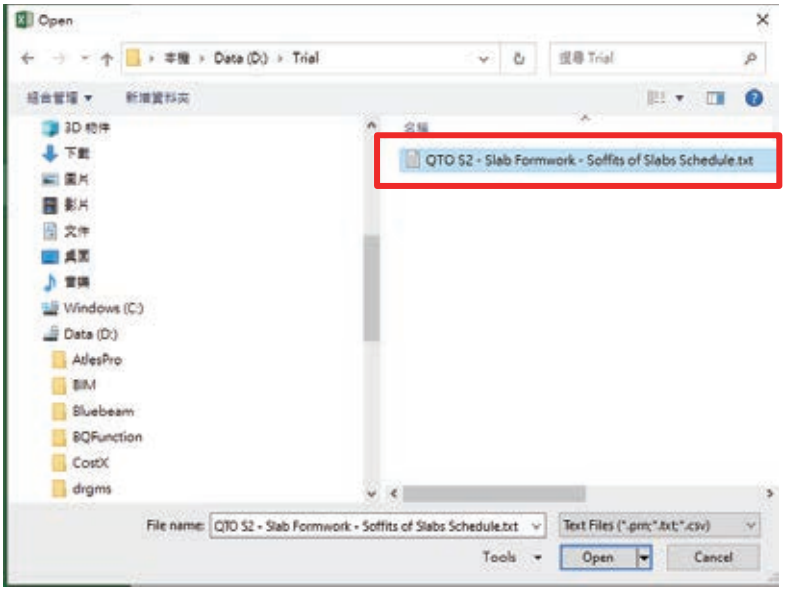


(d) Click **arrow at right bottom corner** of the Excel window.

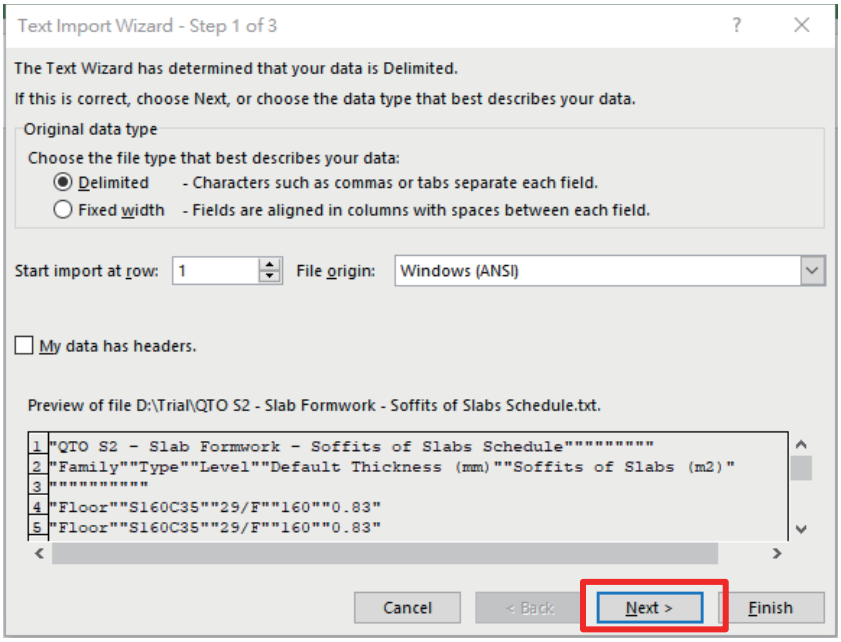
(e) Select Text Files (*.prn;*.txt;*.csv) and "**Open**":



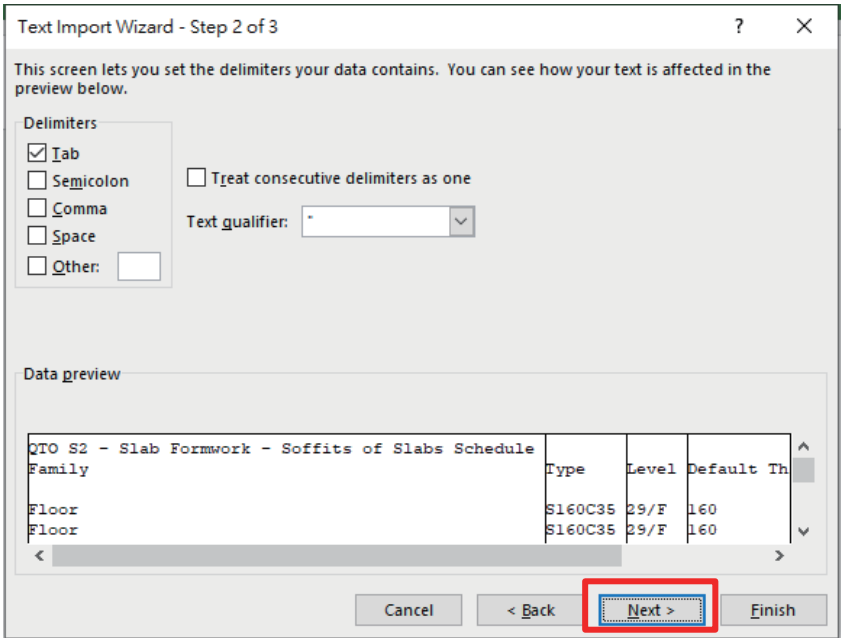
(f) Select the saved "**.txt**" **file** for the Revit schedule:



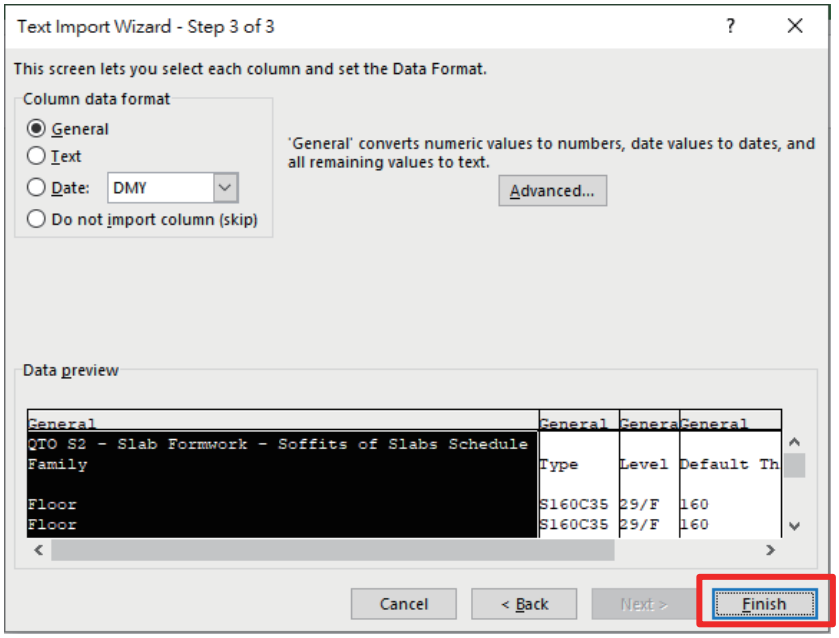
(g) A window of "**Text Import Wizard – Step 1 of 3**" will pop up. It can use the default setting. Click Next > button to the next step:



(h) A window of "**Text Import Wizard – Step 2 of 3**" will pop up. It can use the default setting. Click Next > button to the next step:



(i) A window of "**Text Import Wizard – Step 3 of 3**" will pop up. It can use the default setting. Click Finish button to finish the step:



The file of Revit schedule in "**.txt format**" is transferred to Excel:

	A	B	C	D	E	F	G	H	I
1	QTO S2 - Slab Formwork - Soffits of Slabs Schedule								
2	Family	Type	Level	Default Thickness (mm)	Soffits of Slabs (m2)				
3									
4	Floor	S160C35	29/F	160	0.83				
5	Floor	S160C35	29/F	160	0.83				
6	Floor	S160C35	29/F	160	0.83				
7	Floor	S160C35	29/F	160	0.83				
8	Floor	S160C35	29/F	160	0.83				
9	160:05:00				4.14				
10	Floor	S180C35	29/F	180	1.83				
11	Floor	S180C35	29/F	180	1.92				
12	180:02:00				3.74				

Note: All information transferred to Excel is a text only. The formula created in Revit Schedule cannot be transferred to Excel. Moreover, there is no linkage between the information transferred to Excel and the original Revit Schedule.

27.7.3 Dynamo

Dynamo is a plug-in and an open-source visual programming language for Autodesk Revit. It is a program created by code block, nodes and Python. Dynamo can be used for analyzing complex geometries, automating repetitive processes and exporting data to Excel files and other file-types.

For BIM QTO, quantity surveyors can extract data from BIM models to Excel files by Dynamo. Once the Dynamo scripts are created, they can be saved as templates and applied to another project. Updates on the dynamo scripts may be required to suit individual project needs.

An introduction to the operation of using Dynamo for extracting information from Revit models is provided in the following section – Section 28.

SECTION 28 INTRODUCTION TO DYNAMO

28.1 DYNAMO IN REVIT

28.1.1 Dynamo is a Visual Programming add-on native in Revit. It was engineered for building designer to automate the design process in a parametric way. Unlike the traditional add-on / plug-in development, Dynamo provides an intuitive interface for ordinary user to automate their process while still retains its potential to high-level programming using IronPython. The essential features are:

28.1.2 Nodes:

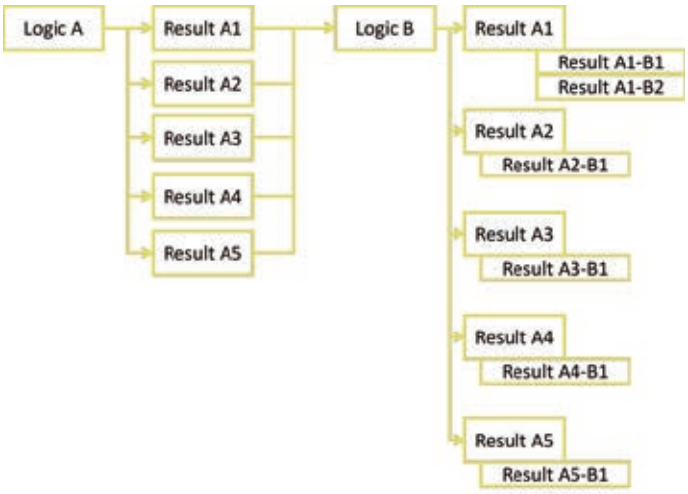
Nodes are pre-defined set of programming script. There are different types of nodes, e.g., Built-in Node, Custom Node, Node from Packages:

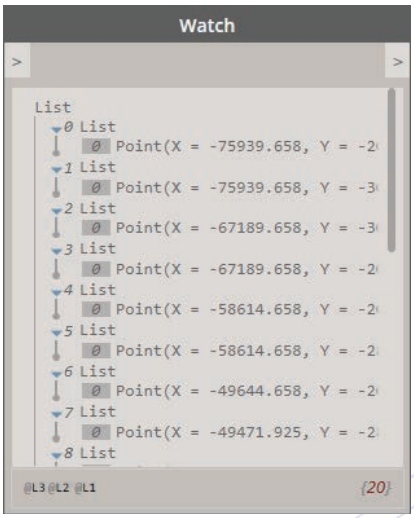
A. *Built-in Node* refers to those came out-of-box with Dynamo and Revit.
B. Custom Node are built by users. It can be built by grouping Built-in Nodes, using code block, or using IronPython at its core.
C. Packages are set of custom nodes prepared by Dynamo experts around the globe and shared on online community.

By connecting various nodes to create complex algorithm, data are being extracted, calculated, interpolated and re-structured to users' requirements. Nodes usually are self-explanatory and further supplemented with explanatory note. The Node approach save users from programming syntax and thus having a mild learning curve.

28.1.3 List:

Another fundamental concept of Dynamo is List management. All data are organized in list. With tiers of list, data are grouped and chained for processing:

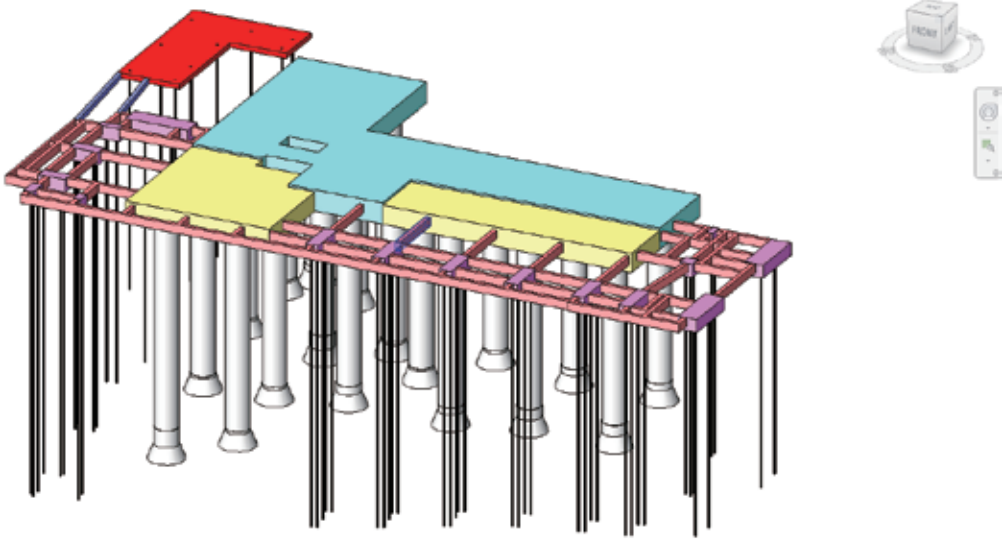


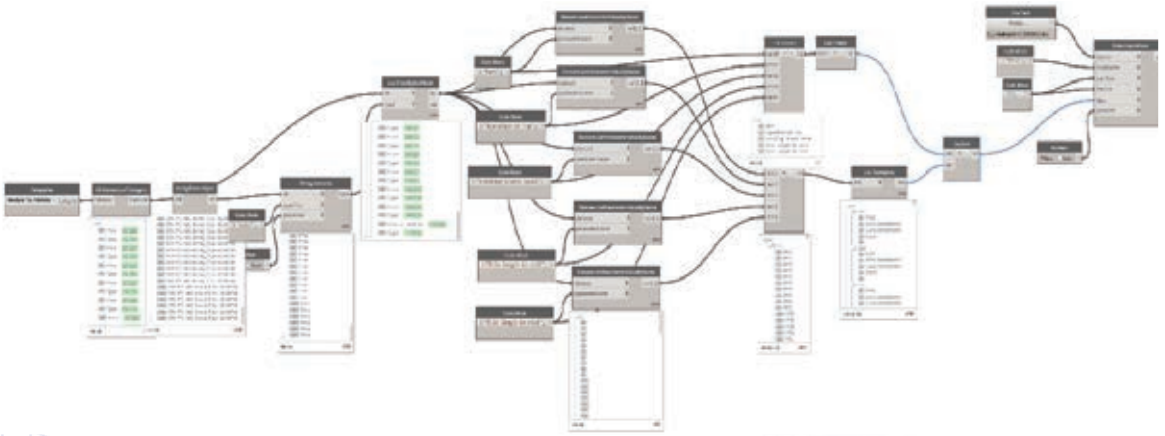


Users can specify the target tier of list for the function to act on. With combination of different tiers, users can perform a function on all data in one list against data in another, thus vice versa.

28.2 EXTRACT MODEL DATA TO EXCEL

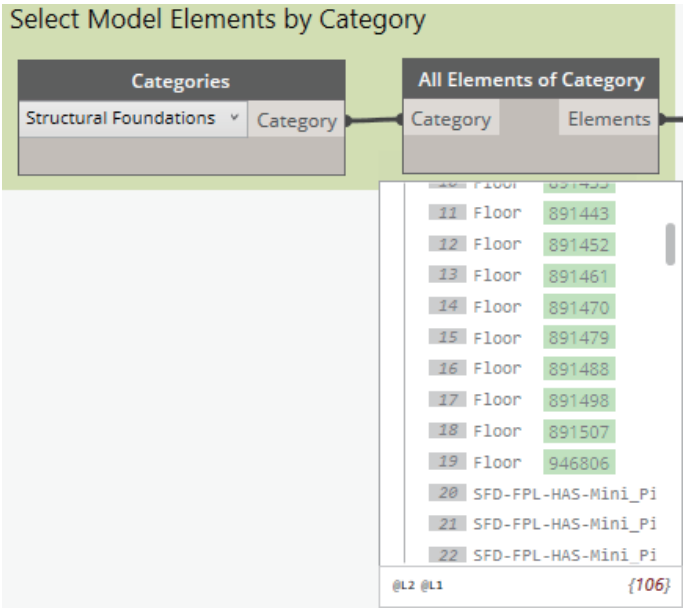
28.2.1 An Overview:



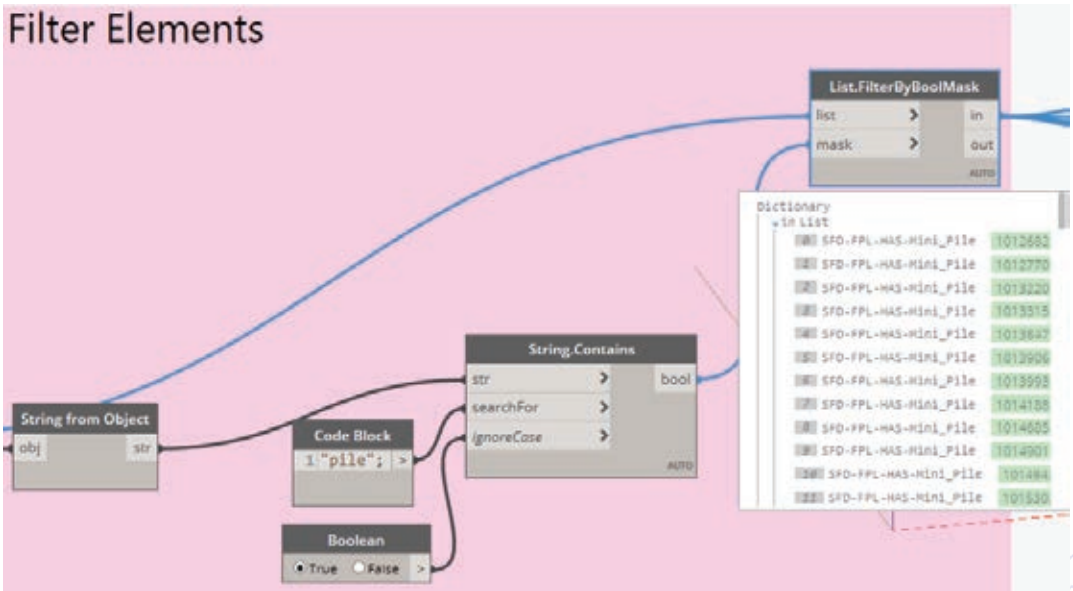


28.2.2 Procedure:

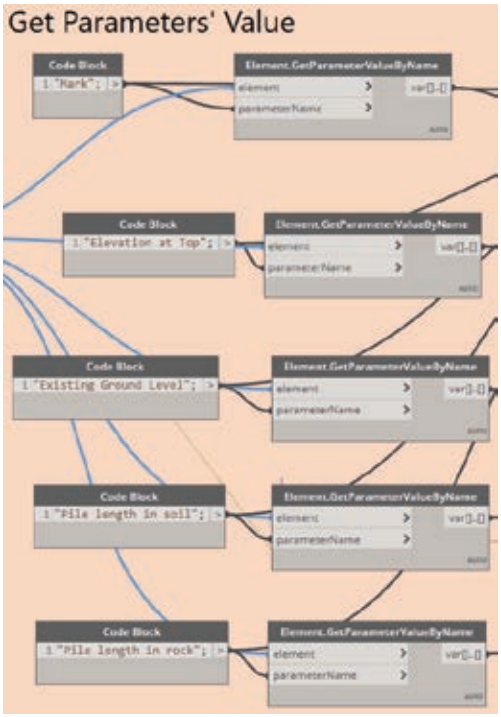
A. Select Model elements by their Categories. For Piles in the sample RVT file, piles are drawn in Structural Foundation Category.



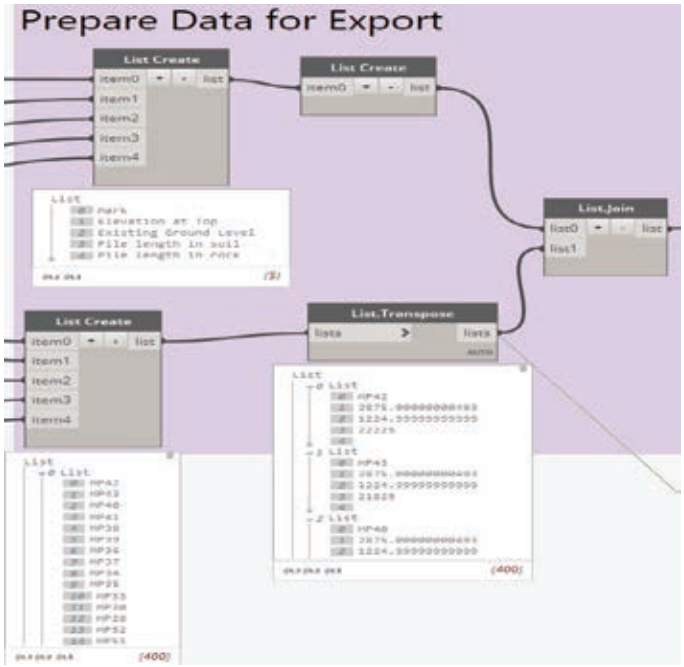
B. The result returned from the selection nodes contains elements other than piles. It is essential to filter out un-intended elements before moving onto the next steps:



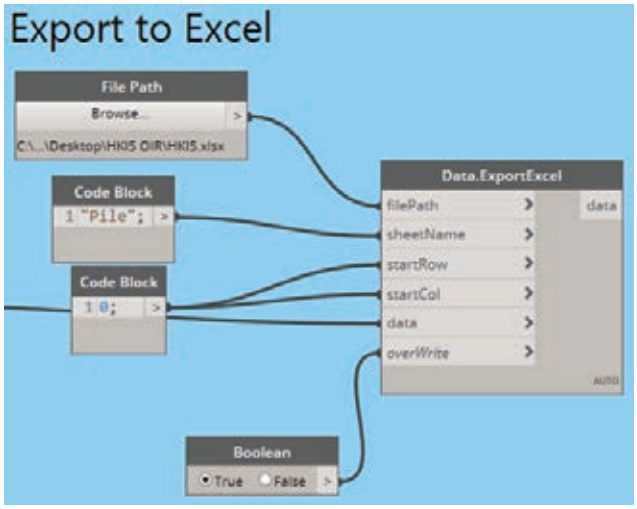
C. After the filtering process, the element list on hand is a clean list of pile elements. Then, information stored in different parameters can be located and extracted. Parameter names must be exacted and are case-sensitive.



D. Each Get Parameter node will return a list of values based on the list of elements input. Multiple lists must be merged into one list for exporting to Excel. Dynamo plots data in each list to Excel in a horizontal manner. To get data presented in the comma fashion, we need to transpose the list before exporting.

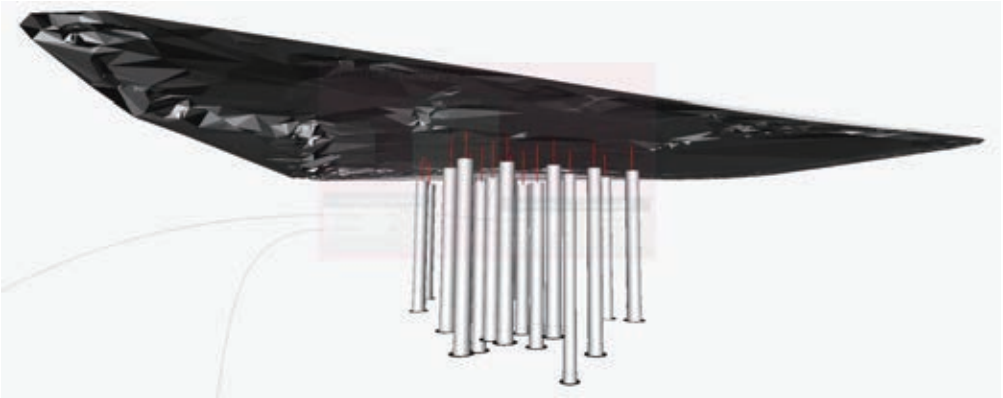


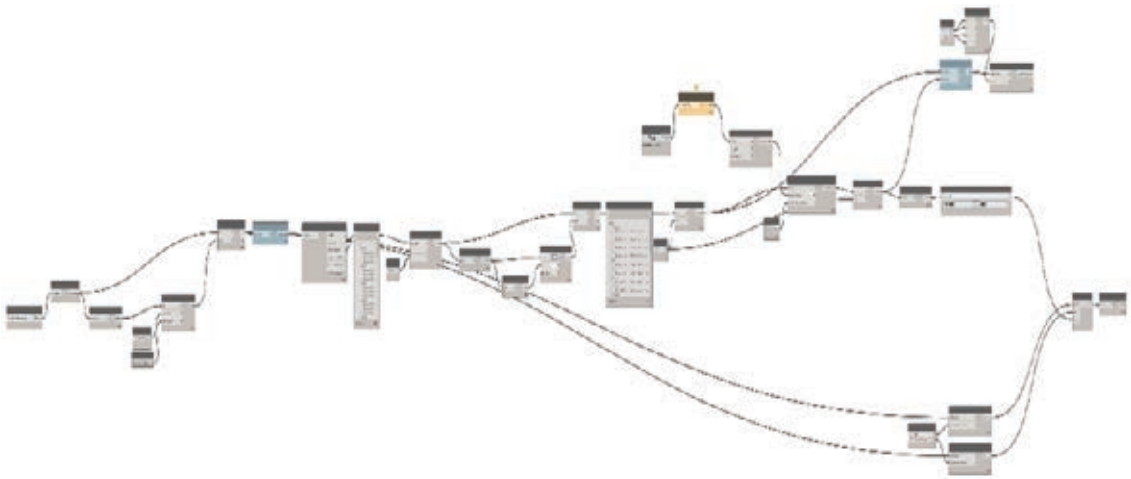
E. Finally, the data are directed into the export to Excel node:



28.3 CALCULATE DATA FROM GEOMETRY

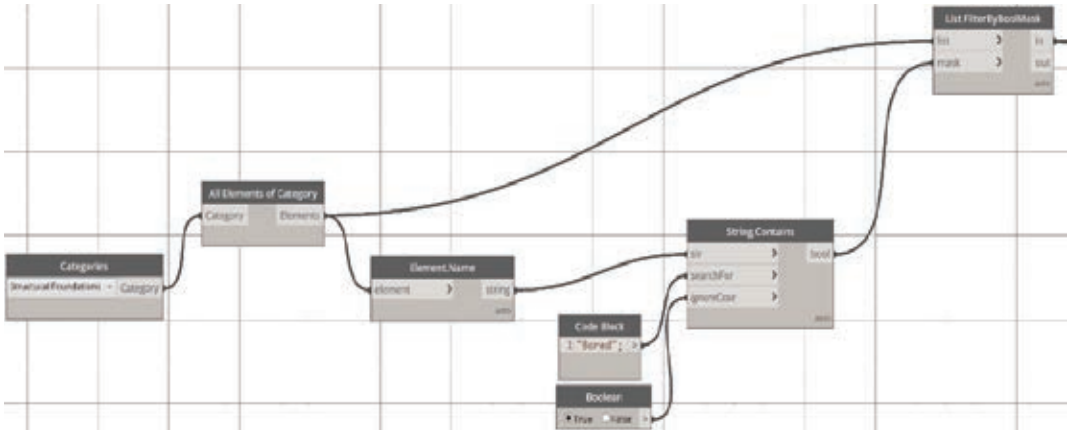
28.3.1 An Overview:



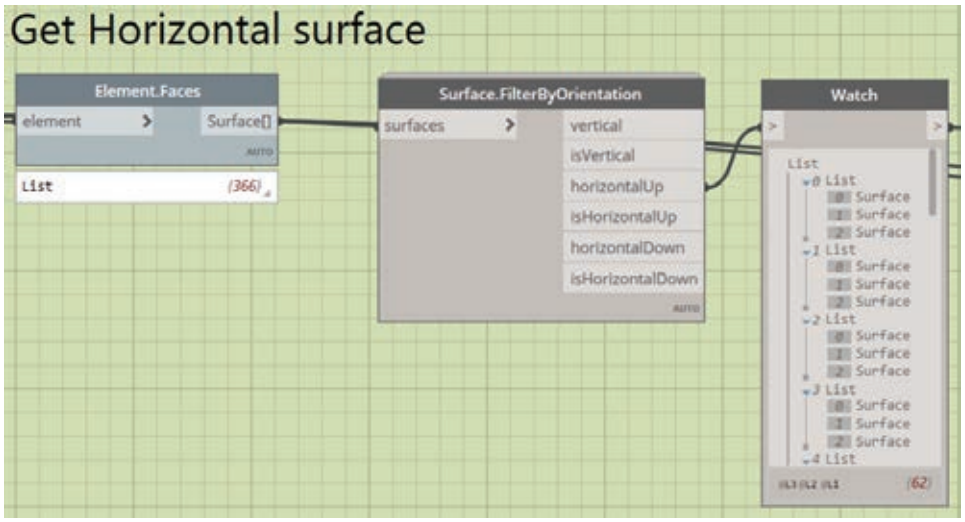


28.3.2 Procedure:

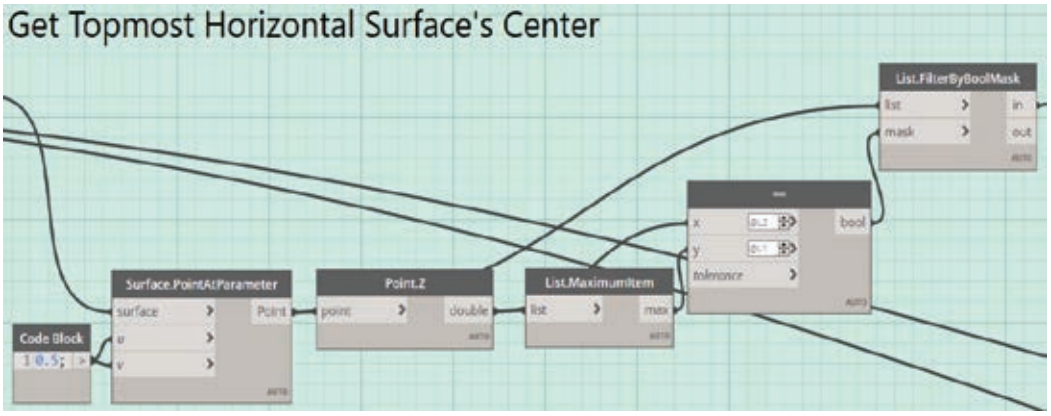
A. Select and filter piles:



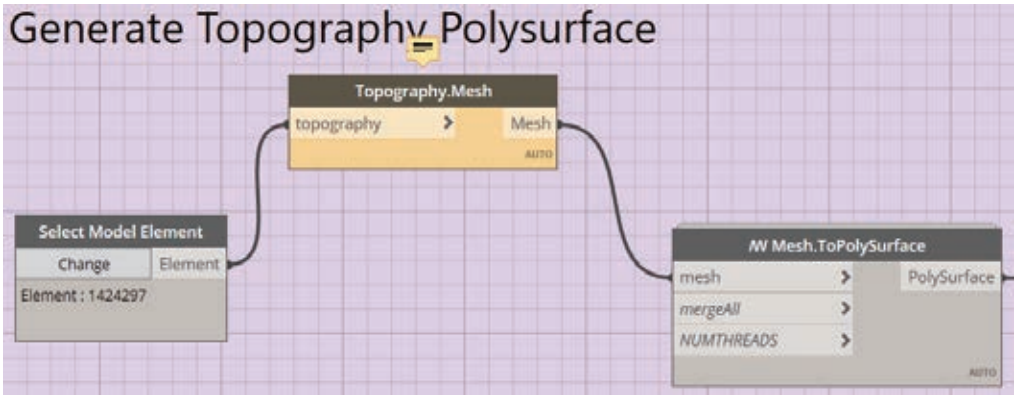
B. Get all horizontal surfaces' geometry:



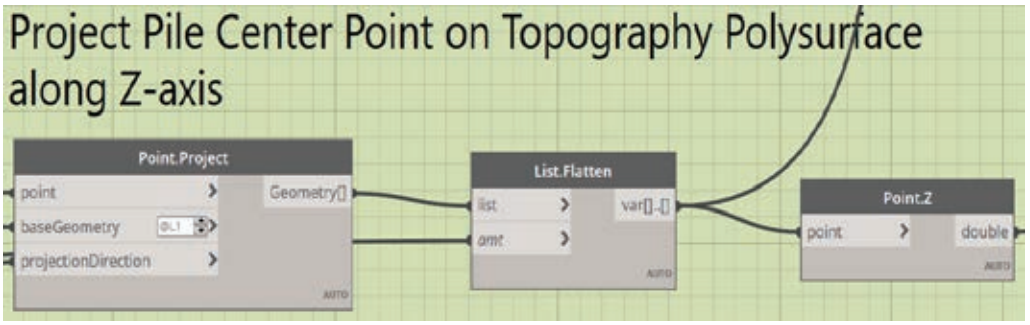
C. Filter the centre topmost surface of piles:



D. Generate Topography PolySurface:



E. Project all centre onto the Topography to get the existing ground level of each pile:



F. Generate a line connecting the Center Point and Projected Point. The line is painted in RED:
